# Detecting data loss from cloud sync applications

---

Jake Williams  
CSRgroup Consultants  
@MalwareJake  
jwilliams@csr-group.com

# BLUF

---

- Just to level set expectations....
- After researching this problem, I don't have a failsafe exfil detection method for cloud sync apps
  - One may not exist using current tools
- I will share some strategies I've used with varying degrees of success

# \$whoami

---

- Chief Scientist at CSRgroup
  - Incident Response/Forensics
  - Penetration Testing
  - Exploit Development
- SANS Instructor and author – Malware, Cloud Forensics, Offensive Forensics
- Two time winner of the DC3 Forensics Challenge
- PhD Candidate (Computer Science)

# Outline

---

- The Problem
- Proof of Concept
- Is DLP the Answer?
- Partial Solutions
- Conclusion

# The Problem

---

- Cloud synchronization applications
  - Dropbox
  - SkyDrive
  - Others
- Data placed in special folders is automatically sent to the cloud
  - And replicated to other devices associated with a user's account

# Problem of Feature?

- For some home users, automatic synchronization of files is a *feature*
- For business users it is often a *liability*
  - Your CEO thinks it's a feature
  - And the CISO knows it's a liability

# Why do you care?

---

- I don't manage a corporate network
  - But I do respond to incidents on them
- For obvious reasons, victims want to know if data was exfiltrated
  - And if so, what data
- That's where we come in as Incident Responders and Forensicators

# Install Privileges

---

- Some cloud synch applications install in the user's profile directory
  - Removes the need for users to have Power User/Admin privileges
- Most apps have moved to a standard "Program Files" installation over the last year
  - Good news for defending against rogue deployments

# Logging

---

- Cloud sync providers offer varying levels of logging
- Logs are commonly found in SQLite databases and flat files
- Most write to user's Roaming profile section
- Good news for enterprise wide searches when Roaming profiles are used

# Authorized or Not?

---

- Business leaders need to carefully evaluate the risks associated with these applications
  - Data leakage channel
  - Increased attack surface
  - Malware command and control (C2)
  - Authorized by the firewall

# Regulated Data

---

- Businesses that store or process regulated data should be especially wary of cloud sync
  - HIPAA
  - GLB
  - PII
  - PCI
- Apps may copy regulated data outside of the enterprise without users even being aware

# eDiscovery Risks

---

- Allowing synchronization of business computer to personally owned devices may open these to eDiscovery
- Best Practice: Inform users in writing of eDiscovery risk on personal devices before allowing installation/use of cloud sync

# DropSmack

---

- Proof of concept penetration testing tool
  - Source released at Blackhat EU 2013
- Allows attackers to use Dropbox for C2
  - Supports programmatic exfiltration of data over Dropbox
- The C2/exfil channel is **not** Dropbox specific
  - Only requires the automatic synch of files

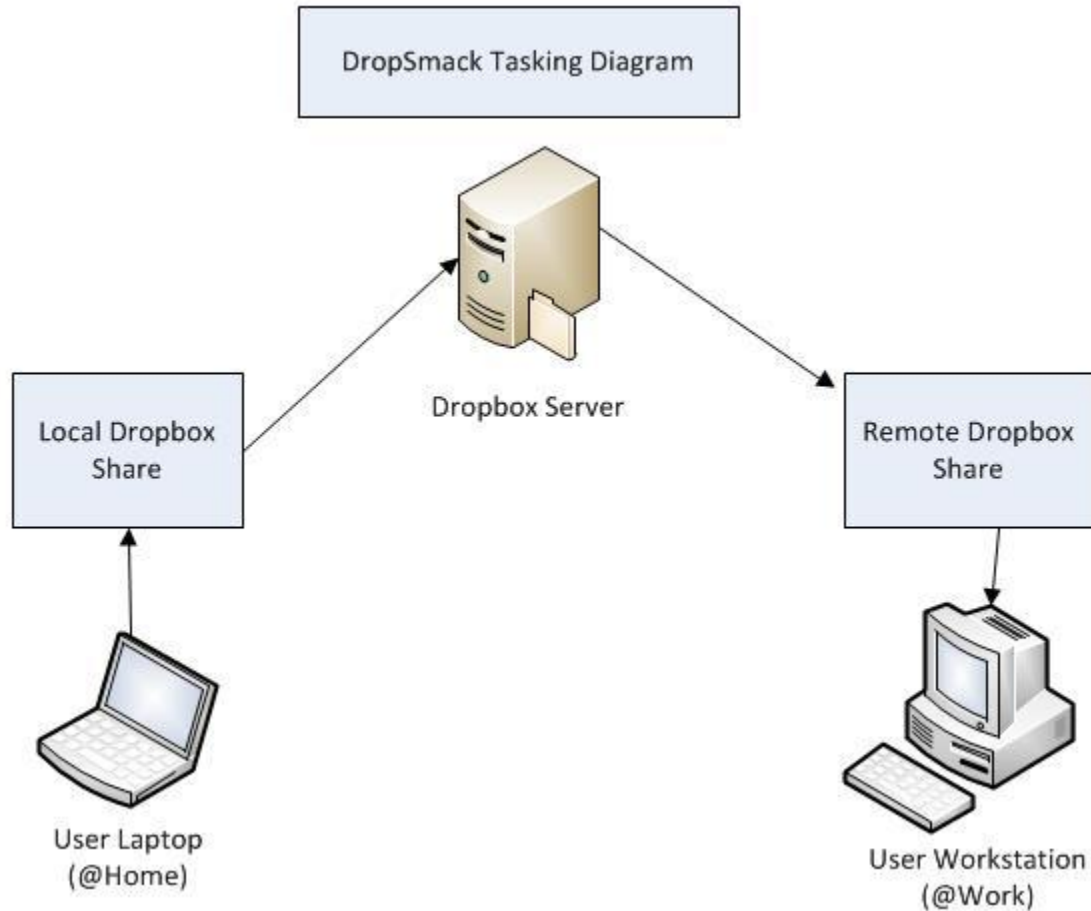

# DropSmack Use Case

---

- Highly secure corporate network
- Exploit road warrior outside the defenses of the corporate network
- Infect files in the user's sync folder
- Wait for user to open files inside corporate network
- Use DropSmack to provide C2, data exfil

# DropSmack Use Case

---

# New DropSmack (v2)

---

- Releasing update at Blackhat USA in July
- Operates on more than just Dropbox
  - Box
  - SkyDrive
  - Google Drive
  - Amazon Cloud Drive
  - Spider Oak
  - SugarSync
  - JustCloud

# Offensive Techniques

---

- Attackers could install cloud sync application on the victim machine
  - `msiexec /q FTW!`
- NSM shows data exfil to cloud sync provider
  - Attacker's IP kept out of high volume connection logs
- PoC only, haven't seen used operationally

# Offensive Techniques (2)

---

- Amazon S3 supplies PowerShell tools
- Write-S3Object CmdLet allows you to upload individual files/folders to S3 Buckets
  - Supports transfers of up to 5GB/file
- I know penetration testers who are using this currently
  - I suspect APT actors are too
  - Malicious insider potential as well

# Demo

---

- Since a seeing is believing...

# The Threat

---

- To review:
  - Malicious insider – purposefully exfiltrates data using cloud sync
  - Clueless insider – unintentionally shares regulated/sensitive data via cloud sync
  - Malicious actor -

# DLP Solutions

---

- Do DLP solutions cover Dropbox?
  - Sort of (read not really)
- Solutions focus on blocking:
  - Dropbox application from running
  - Dropbox communicating on the network
- Problems
  - Sledgehammer approach
  - Application specific

# DLP - Symantec

---

- One forum post suggests file inspection using “Copy to Hard Drive” option
  - No other references to this option found in documentation
- Another post suggests blocking web communications
  - Sledgehammer approach

# DLP - McAfee

---

- McAfee support engineer highlights the problem  
*"there's no rule available to block local file transfers"*
- Suggests network blocking rule

# DLP - Others

---

- Core problem: if a user can save a file to their profile, they can save it to the cloud
  - DLP solutions must be cloud sync app aware
- Covering default sync directories is a start
  - But not the end
- Searches for DLP solutions that actually address this issue came up empty
  - But it's a hard problem

# NGFW

---

- Next generation firewalls may offer some capabilities against data loss through cloud providers
- Proxy SSL traffic and decrypt it
- Must integrate with DLP solutions
  - Distinguish legitimate file sync from data exfil

# Amazon S3

---

- Amazon S3 offers cloud storage
  - Dropbox uses S3 as storage backend
- S3 also used by many CDNs
  - NGFW useful to differentiate S3 CDN traffic from file sync

# Cheaper Alternative

---

- Squid proxy can be used for SSL inspection
- Log excerpts below show Dropbox access via a web browser
- Similar information available from standalone application

```

```

# NSM Solution

---

- Security Onion supports Bro and ELSA out of the box
  - Point and click installation
- Since becoming a convert, I use bro in all of my IR jobs
  - Using bro to detect cloud sync data exfil is a sledgehammer approach ☹️
  - Still useful

# Netflow for Exfil Detection

---

- Workstations normally receive more data than they send
  - Machines used by attackers to pivot into the network and exfil traffic violate this pattern
- Machines using cloud sync often violate this pattern due to high bandwidth backup traffic
  - Look more granularly at the traffic
  - Look at cloud sync traffic in relative isolation

# Bro Logs - DNS

---

- Bro DNS logs are very useful for locating machines running cloud sync software
- Fields
  - id.orig\_h -> source IP
  - query -> hostname
  - answers -> shows the answers IPs resolved

# Bro Logs - Connections

---

- Bro DNS logs are very useful for locating machines running cloud sync software
- Fields
  - id.orig\_h -> source IP
  - id.resp\_h -> dest IP
  - orig\_ip\_bytes -> bytes sent
  - resp\_ip\_bytes -> bytes received

# Bro Logs - Mashup

---

- Use DNS logs to find IP addresses used by cloud sync providers
- Use connection logs to look for hosts with unusually high outbound traffic to those IP addresses
  - You define “unusually high”
  - No traffic inspection, could be legitimate sync traffic or exfil

# LAN Sync

---

- Some sync providers offer LAN Sync
- Allows multiple computers on same LAN to sync with one another directly
  - Only one copy comes in from cloud
  - Saves bandwidth
- This is an attack surface I'm actively investigating

# LAN Sync (2)

---

- Clients broadcast constantly to find new friends on the network
  - Reminiscent of NetBIOS 😊
- Easy to find in PCAP
  - Helps to locate illicit cloud sync app installations

# LAN Sync - Dropbox

- Dropbox uses TCP and UDP 17500
  - Two broadcasts every 30 seconds
- Unique ID (user) plaintext in broadcast
  - Probably not useful for detecting exfil

The image shows a network traffic capture with several rows of data. The first row is highlighted in light blue and contains the following information: 6, 9.03009100, 192.168.154.132, 255.255.255.255, DB-LSP-, 154, Dropbox LAN sync Discovery. The second row is highlighted in light blue and contains: 7, 9.03118900, 192.168.154.132, 192.168.154.255, DB-LSP-, 154, Dropbox LAN sync Discovery. The third row is highlighted in light green and contains: 8, 10.1952660, fe80::f0f8:2028:49b ff02::c, SSDP, 208, M-SEARCH \* HTTP/1.1. The fourth row is highlighted in light green and contains: 9, 12.1010440, fe80::f0f8:2028:49b ff02::c, SSDP, 208, M-SEARCH \* HTTP/1.1.

Time	Source	Destination	Protocol	Length	Application
6	9.03009100	192.168.154.132	255.255.255.255	DB-LSP-	154 Dropbox LAN sync Discovery
7	9.03118900	192.168.154.132	192.168.154.255	DB-LSP-	154 Dropbox LAN sync Discovery
8	10.1952660	fe80::f0f8:2028:49b ff02::c	SSDP	208	M-SEARCH * HTTP/1.1
9	12.1010440	fe80::f0f8:2028:49b ff02::c	SSDP	208	M-SEARCH * HTTP/1.1

# User Profiles

---

- Examine user profiles for existence of default sync folders
  - Remember that users can configure additional sync folders / change default
- Scan files currently in sync folders for sensitive information
  - I use document parsers + keyword list for this

# User Profiles (2)

---

- Connect to C\$ on user machines
- If investigating a domain and roaming profiles are enabled, go to profile store
- Only finds files currently in the sync folder

# Application Logs

---

- Some application logs may include information about files synchronized
  - Useful for files that no longer exist on host machine or in cloud
- Many apps write logs into user's Roaming profile directory
  - Potential for one-stop shopping
- File name/size only
  - No content, but some apps store file hashes

# Log Examples

- JustCloud

```
29-06-2013 13:45:24:1374 - Include/Exclude for current backup:

# Application Databases

---

- Many cloud sync apps store information in SQLite database files
  - More often than plaintext logs, these tend to store file hashes
- Use SQLite and Python to dump databases to text and search for keywords
  - Use more surgical searches only if keyword hits are found

# Database Examples

---

- JustCloud
  - mpcb\_file\_cache.db

path	fileName	hash	size	mtime

# Web Applications

---

- Many cloud sync providers also support access via web applications
  - Web apps may keep records of files that were deleted on the host
- In some cases, the deleted file itself may be available for a period of time
  - Like a 'Recycle Bin' in the cloud

# Web Applications (2)

---

- If writing a warrant/eDiscovery subpoena, request access to suspect's online storage accounts
  - Common procedure for webmail
- Logs on the web application have the best historical record of sync activity
  - Most online logs are not editable by the user
  - Many log source IP addresses

# Dropbox RSS

---

- Dropbox is unique in offering RSS
- If configured, you could at least monitor file names being synchronized

## You added the file crashre....

---

Today, June 29, 2013, 1 minute ago →

You added the file [crashreporter.exe](#).

## You invited [REDACTED].

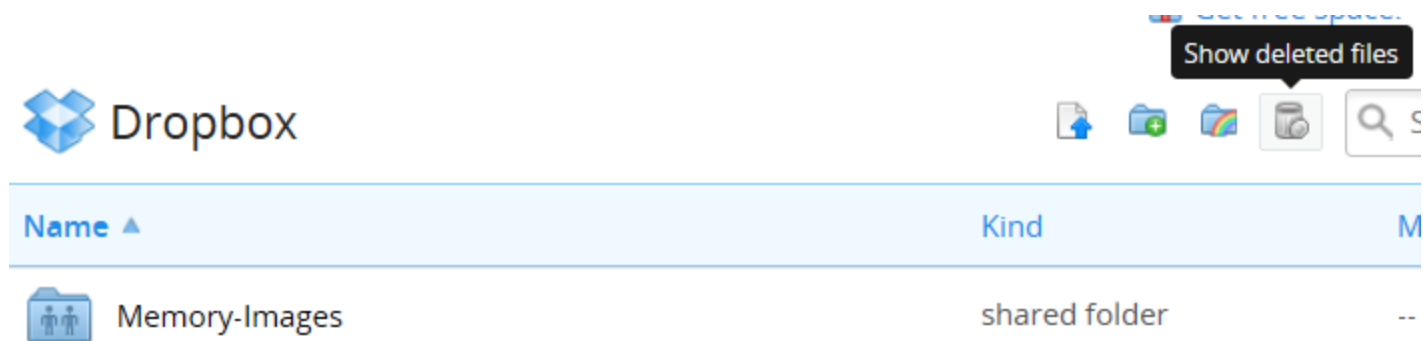

---

Today, June 29, 2013, 4 minutes ago →

You invited former33t@gmail.com to the shared folder '[a](#)'

# Dropbox Deleted Files

- Dropbox allows the display/restoration of deleted files
- All accounts get storage of 30 days of deleted files

# Dropbox Deleted Files (2)

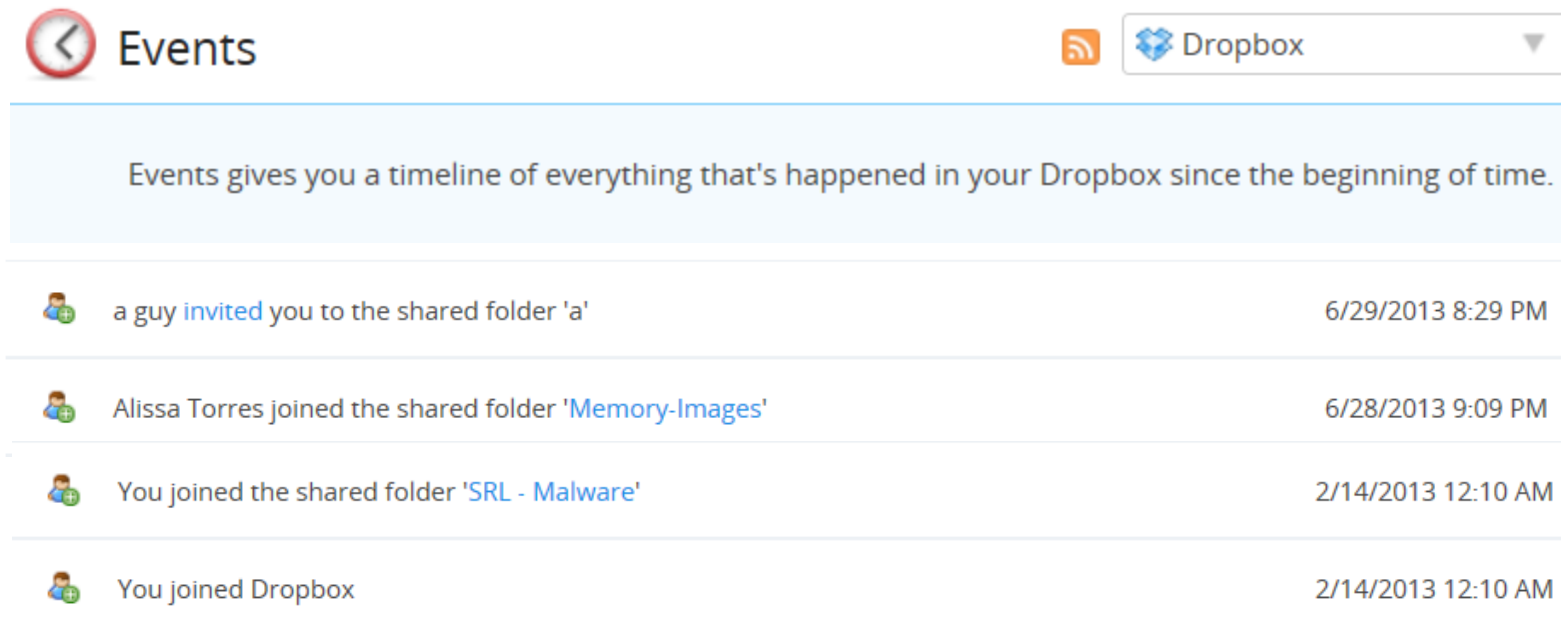

---

- Dropbox Pro and Dropbox Business may use an add-on called PackRat
  - Packrat offers unlimited recovery of deleted files/folders (not retroactive)
- Also offers version history for sync'd files
  - Especially interesting in eDiscovery cases
  - Depending on your goals, either mandate these settings on or off

# Dropbox Events

- Perpetual log of Dropbox activity

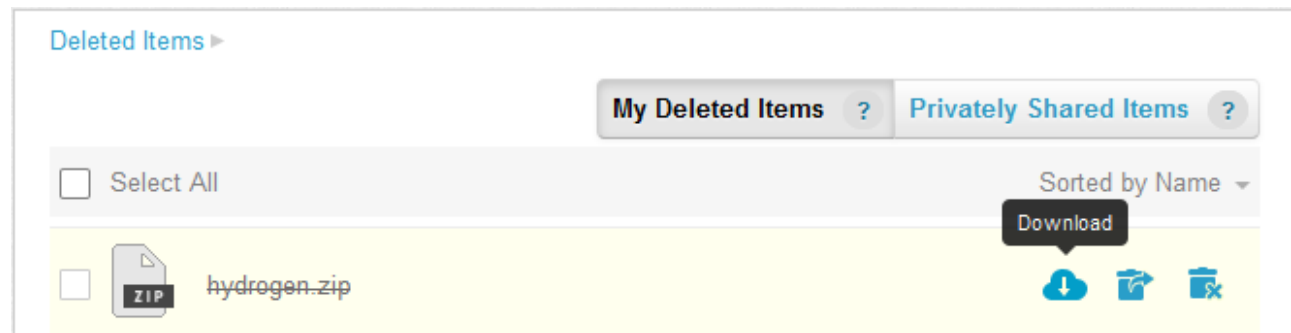

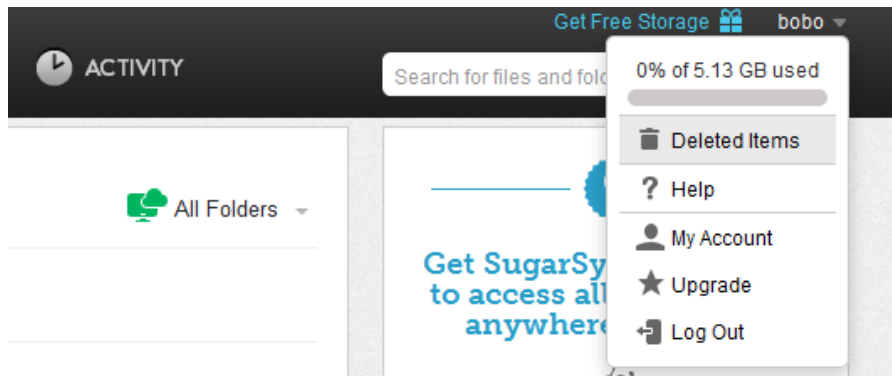

The screenshot shows the 'Events' page in Dropbox. At the top left is a back arrow icon and the word 'Events'. To the right is an RSS icon and a dropdown menu with the Dropbox logo and the text 'Dropbox'. Below this is a light blue box containing the text: 'Events gives you a timeline of everything that's happened in your Dropbox since the beginning of time.' Below this box is a list of four events, each with a user icon, a description, and a timestamp.

Event Description	Timestamp
a guy invited you to the shared folder 'a'	6/29/2013 8:29 PM
Alissa Torres joined the shared folder 'Memory-Images'	6/28/2013 9:09 PM
You joined the shared folder 'SRL - Malware'	2/14/2013 12:10 AM
You joined Dropbox	2/14/2013 12:10 AM

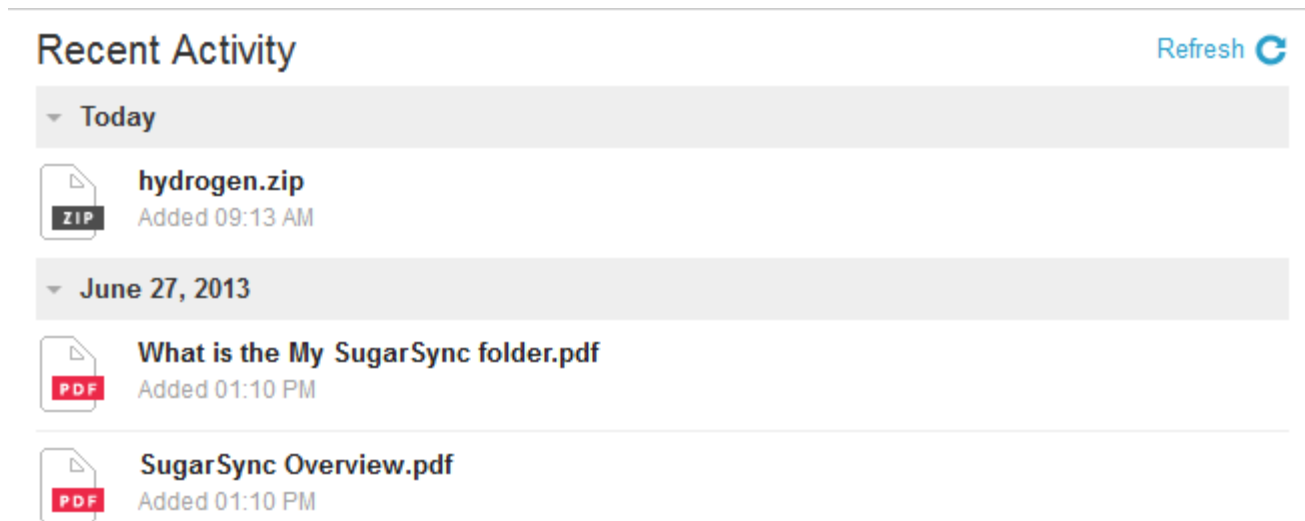

# SugarSync Deleted Files

- SugarSync allows remote restoration of deleted files or download directly from m

# SugarSync Logs

- The web interface lists files added
  - Not as granular as Dropbox Events
  - Doesn't show files shared or deleted

# Conclusions

---

- There's currently a technology gap for detecting data exfil via cloud sync apps
- NSM helps
  - But only when clients have it in place
- Local log files on some apps fill some gaps
  - Limited information though
- Web app logs are the best resource
  - When you can get \*legal\* access to them

# Questions?

---

Thanks for your time!

Jake Williams
